Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Case Worker:	JC
RB Case Number:	9UT1585
Local Agency:	SAN DIEGO COUNTY LOP
File Location:	Local Agency
Local Case Number:	H04351-001
Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Gasoline
Site History:	The Site is located in Escondido, California on the south side of West Mission Avenue near the intersection with Rock Springs Road. The Site was formerly a 76 gas station with three 12,000-gallon fuel USTs: one regular unleaded gasoline UST, one premium unleaded gasoline UST, and one diesel UST. Underground piping connected the USTs to four fuel dispensers located on two islands in the central portion of the site. The USTs, piping, and dispensers were removed from the site in July 1999. The site is currently a paved parking lot. In May 1989, ten soil borings (B-1 through B-10) were advanced at the Site. Based on the results of the soil and groundwater assessment, DEH opened Unauthorized Release Case H04351-001 on December 26, 1989. In July 1999, the USTs, dispensers, and product piping were removed from the site. Approximately 531 tons of petroleum hydrocarbon-contaminated soil were excavated and disposed off-site as part of the station demolition and UST removal. In August 2006, a soil vapor extraction (SVE) feasibility test was conducted to evaluate the effectiveness of using SVE to remediate hydrocarbon contaminated soil at the site. Based on the results of the SVE feasibility test, it was concluded that SVE is a feasible remediation method for the site. Approximately 324 pounds of hydrocarbons were removed from soil during SVE testing. In August 2012, eight soil vapor probes were installed at the Site. Soil vapor samples were collected from the probes on September 14 and 28, 2012. Based on the results of the Level 1 Vapor Risk 2000 Model, it was concluded that the cumulative potential excess lifetime cancer risk for occupants of the commercial building adjacent to the Site for commercial exposure scenarios was estimated to be approximately 8.88 x 10-9. Based on this risk information, it was considered unlikely that possible upward diffusion and indoor vapor migration of benzene, ethylbenzene, naphthalene, and MTBE present in the subsurface at the site could pose a significant health risk to the occupants of the commercial building located adjacent to the Site. Eleven groundwater monitoring wells have been installed for the case. Monitoring of onsite and offsite groundwater monitoring wells was conducted at the site between June 1989 and December 2015. Based on the linear regression timeframes, the maximum contaminant level (MCL) for MTBE will be reached in approximately 17 years. The mass of impacted soil >100 mg/kg TPH was calculated. The estimated mass of residual impacted soil at the site is 367 pounds. The case for closure was evaluated under the States Low-Threat Underground Storage Tank Case Closure Policy (the Policy). Current and historical soil and groundwater data indicate that the secondary source has been adequately removed and a stable to decreasing plume remains. Site conditions meet the general and media-specific criteria established in the Policy. Public notification was conducted per the Policy. No comments were received. Permit DEH2016-LSAM-00 was issued for destruction of the existing monitoring wells.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART)

FREEWAY TRAILER SALES (Continued) **1000225210**

provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Classification: Not a generator, verified

Date form received by agency: 05/23/1996
Site name: PRESSLEY PETERBILT
Classification: Small Quantity Generator

Violation Status: No violations found

FINDS:

Registry ID: 110055807809

Environmental Interest/Information System
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

PRESSLEY PETERBILT (Continued) **1001111721**

STATE MASTER

Registry ID: 110009552572

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

FINDS:

Registry ID: 110002832436

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

ESCONDIDO SAND & GRAVEL WORKS (Continued) **1000338524**

program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Status:	Completed - Case Closed
Status Date:	02/28/2014
Case Worker:	Not reported
RB Case Number:	9UT494
Local Agency:	Not reported
File Location:	Local Agency
Local Case Number:	Not reported
Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Gasoline
Site History:	Two underground storage tanks were removed from the site in April 1987 and petroleum hydrocarbons were observed in sample results. Liquid-phase hydrocarbons (LPH), up to 3.56 feet, were observed at the site. LPH removal was conducted until 1997 and 360 cubic yards of hydrocarbon impacted soil were excavated and disposed. Numerous wells and borings were installed at the site in order to assess hydrocarbon-impacted soil and groundwater.

FINDS:

Registry ID: 110002712048

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Potential Media Affect: Aquifer used for drinking water supply
Potential Contaminants of Concern: Benzene, Diesel, MTBE / TBA / Other Fuel Oxygenates, Gasoline
Site History: Contamination was identified on this site in 2003. Site assessment activities have been required to determine the vertical and lateral extent of contamination and determine the residual contamination on site. This includes assessment of any environmental impact that may remain. At this time, additional groundwater monitoring is required to establish the trends of constituents on site. Please see the Environmental Data tab for additional site specific information.

Site History: The North County Transit Center site is located on the south side of Norlak Avenue, between North Quince Street and North Spruce Street in Escondido. During a geotechnical investigation conducted in 2007, soil with a strong petroleum odor was encountered within the proposed new building footprint at the Escondido Bus Maintenance Facility. A Soil Management Plan (SMP) was prepared and submitted to the Department of Environmental Health (DEH). A Voluntary Assistance Program (VAP) case H10505-003 was opened on August 20, 2007 to continue with construction. It is not clear whether DEH approved the SMP, as there is no evidence of this in the case file. Also, in October 17, 2007, North County Transit District requested withdrawal from the VAP program oversight. The case was inactivated on November 6, 2007. In August 2007, thirteen direct push borings were advanced to delineate the residual contamination; however five borings encountered refusal at a depth of 5 feet below ground surface (bgs). Groundwater was encountered in six borings at depths ranging from 10 to 20 feet bgs and temporary groundwater monitoring wells were installed. Free product was not observed in any of the wells, and

NORTH COUNTY TRANSIT DIST (Continued) **1000405632**

laboratory analysis of both soil and groundwater samples results indicated impacts with total petroleum hydrocarbons (TPH). The TPH-gasoline concentrations in groundwater sample results were as high as 18,000 a%g/l. Low concentrations of ethylbenzene, xylene, and naphthalene were also found is several of the soil samples. Based on the proposed SMP, an area of 130 feet long x 110 feet wide, to a depth of 11 feet was to be excavated in the building footprint. TPH-impacted soil was to be transported off site for disposal. According to later reports, soil confirmation samples were collected and the results indicated there was residual TPH contamination up to 3,500 mg/kg in the diesel range. This information is based on a report dated November 7, 2007, prepared by Kleinfelder, which we currently do not have in our case file. The figures presented in the work plans submitted in 2009, show the excavation boundaries in relationship to the footprint of the new bus maintenance garage; however, there is no scale on the figures. A scale was noted on figure 6 in the later April 19, 2011 soil and groundwater assessment report. Due to the review of the sample results from the 60-day report submitted in June 2008 for the direct push borings, DEH reactivated VAP H10503-003 in January 2009, and requested additional delineation of the soil and groundwater contamination. Shortly afterwards, in February and March 2009, a hydraulic lift was removed from the existing office and maintenance building located immediately to the north of the new building. During the lift removal, a strong petroleum odor was noted in the soil to a depth of 11.5 feet. An area 10 feet x 9 feet to a depth of 11.5 feet was excavated in this area, and impacted soil was transported off site. Confirmation samples were obtained from the base and sidewalls of the excavation. The analytical results indicated there was residual contamination with the highest concentration of TPH, in the diesel range, of 815 mg/kg from a bottom sample. A work plan was submitted to DEH on October 21, 2009, to delineate the contamination near the northeastern corner of the new bus maintenance garage building and near the former hydraulic lift. The work plan was revised on March 23, 2010, and was approved by DEH in July 2010. Three monitoring wells were installed in January 2011 and groundwater sample results indicated dissolved TPH in the diesel range and several volatile organic carbons (VOCs) such as tetrachloroethene, trichloroethene, and xylene. Groundwater depths ranged between 13.75 and 14.24 bgs. Soil sample results obtained from the drilling of the monitoring wells had concentrations of TPH gasoline, diesel and oil. The consultant requested no further action based on source removal and low concentrations, below the EPAs regional screen levels (RSLs), of contaminants of concern. DEH requested another round of groundwater monitoring prior to closure and this was conducted on May 17, 2012. The 2012 groundwater analytical results had concentrations that were less than during the first round. The consultant recommended no further action and removal of the monitoring wells. DEH concurred with the consultants recommendations. The monitoring wells were removed on March 10, 2016 under monitoring well permit DEH2016-LMWP-002176.

FINDS:

Registry ID: 110008270487

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource

NORTH COUNTY TRANSIT DIST (Continued) **1000405632**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Lead Agency Case Number:	Not reported
Latitude:	33.1274796571958
Longitude:	-117.095519900322
Case Type:	Cleanup Program Site
Case Worker:	Not reported
Local Agency:	Not reported
RB Case Number:	2094000
File Location:	Regional Board
Potential Media Affected:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Not reported
Site History:	Approximately 212 tons of contaminated soil excavated from the northwest corner of the building, which was formerly used as a dry cleaning facility. The Regional Board has requested the submittal of a work plan that addresses the source and nature of VOCs in soil gas. Ground water monitoring activities are being conducted to evaluate temporal and spatial trends in contaminant concentrations. David Kahn filed for bankruptcy in July 2010. A new case has been opened for this site - see T10000003383. This case was administratively closed but is still open in the cost recovery program since monies are owed to the state.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Case Type:	Cleanup Program Site
Case Worker:	CH
Local Agency:	SAN DIEGO COUNTY LOP
RB Case Number:	Not reported
File Location:	Local Agency
Potential Media Affected:	Soil, Soil Vapor
Potential Contaminants of Concern:	Diesel, Gasoline
Site History:	On August 27, 2003, DEH received an application to the Voluntary Assistance Program (VAP) for the site. During grading in 2002, stained and odorous soil was encountered in the southeast corner of the site, and was subsequently excavated and removed. DEH received a report summarizing the results of post-excavation soil sampling as part of the VAP application, and the Responsible Party requested DEH concurrence with the report. Total petroleum hydrocarbons from gasoline were detected at a maximum 120 milligrams per kilogram (mg/kg) at a depth of six feet below ground surface (bgs) in the

AMS WAREHOUSE (Continued) **S106874686**

southeast corner of the site. The sample also contained benzene at 0.08 mg/kg. Using the SAM Vapor Risk Model, the consultant determined that the cancer risk from benzene vapors to employees on site was 1.52 x 10-6. Based upon these results, DEH required additional confirmation soil samples to determine the extent of petroleum contamination remaining on site and further risk assessment. DEH also requested that the consultant provide details regarding the excavation, including the amount of soil excavated and the amount of soil removed from the site. In a subsequent report, the consultant stated that 215 cubic yards of soil was excavated in 2002. Approximately 175 cubic yards of this soil was impacted with petroleum and removed from the site. The remaining 40 cubic yards of soil was reused on site. Further assessment was completed in 2012 to assess the extent of petroleum-impacted soil remaining on site. Soil samples were obtained from three borings in the southeast corner of the site, and a direct-push probe inside the warehouse on site. Petroleum hydrocarbons were detected in the gasoline, diesel, and oil ranges at a maximum of 49.85 mg/kg at depths of 1.5 to 10 feet bgs. Volatile organic compounds (VOCs) were detected in 4 of the 17 soil samples collected. Benzene was not detected in any of the samples. The consultant concludes that petroleum-impacted soil remains on site, does not extend deeper than 10 feet bgs, and is bounded by dense bedrock. A soil vapor probe was installed in the warehouse to assess vapor risk to on site employees. VOCs were not detected in the soil vapor sample, and the consultant concludes that there are no apparent adverse impacts to human health for AMS Warehouse personnel. To determine whether groundwater at the site had been impacted, grab groundwater samples were collected from one of the borings and the direct-push location. Petroleum constituents were detected in both groundwater samples, and benzene was detected at 2.7 micrograms per liter in the groundwater sample from the southeast corner of the site. No other VOCs were detected above their respective Maximum Contaminant Levels. The consultant states that an on-site source of the contamination in the southeast corner of the site could not be identified, and attributes the petroleum impacts to groundwater to the Unauthorized Release at the RCP Block and Brick property (H08237-001), located up-gradient of the site at 1070 West Mission Avenue. The consultant concludes that petroleum-impacted groundwater has migrated down-gradient to the site from RCP Block and Brick, and created a smear zone of petroleum-impacted soil on site. DEH requested that the consultant provide an estimate of the amount of petroleum-impacted soil that remains on site, and the consultant responded that all of the petroleum-impacted soil associated with VAP case H39633-001 was removed in 2002, and that the remaining petroleum-impacted soil has an off-site source. Based upon the soil sampling data and cross-sections submitted with the report, DEH estimates that approximately 160 cubic yards of petroleum-impacted soil remains on site. The consultant recommends that the case be closed since there is no source of contamination on site, petroleum impacts to soil and groundwater remaining on site are from an off-site source, and there is a very low health risk to on site workers. DEH concurs that it is possible that contaminated groundwater has migrated to the site from RCP Block and Brick; however, there is no evidence to confirm this conclusion. After reviewing DEH records for the site, it is also possible that the groundwater contamination observed is from an on-site source. Historically, two 6,000 gallon underground storage tanks (USTs)

AMS WAREHOUSE (Continued) **S106874686**

containing gasoline were located at the site. These USTs were closed in place in 1983 and removed from the site in 1998. DEH staff noted discolored and odiferous soil around the USTs in 1997 when the USTs were discovered during grading; however, petroleum constituents were not detected in soil samples collected when the USTs were removed. Although groundwater was observed in the UST excavation at 10 feet bgs, a groundwater sample was not analyzed. Since the groundwater was not sampled, it is unknown whether groundwater had been impacted at that time. Regardless of the source of the contaminated groundwater on site, DEH concurs with the consultant that horizontal characterization of impacted groundwater is not warranted given the low concentrations of petroleum constituents detected. DEH also concurs that the petroleum contamination remaining on the site does not represent a health risk to employees of the warehouse on site. DEH further concurs with the consultants recommendation to close the case.

Potential Media Affect: Aquifer used for drinking water supply
Potential Contaminants of Concern: Gasoline
Site History: Three undergound storage tanks were removed from the site in December of 2005. A release had occurred from the former dispenser island. Site assessment for soil and groundwater contamination has been proceeding. Verification is underway to distinguish this site's release from a release that occured to the north on the other side of West Washington. Joint sampling of wells is being performed on a semi-annual basis.

RB Case Number:	Not reported
Local Agency:	Not reported
File Location:	Regional Board
Local Case Number:	Not reported
Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Gasoline
Site History:	Three underground storage tanks were removed from the site in the early 1980's. Site assessment for soil and groundwater contamination began in 2002 and continues. Free product is found in on-site wells. The extent of migration of the contaminant plume is currently being assessed.

RB Case Number: Not reported
Local Agency: SAN DIEGO COUNTY LOP
File Location: Local Agency
Local Case Number: H04771-001
Potential Media Affect: Aquifer used for drinking water supply
Potential Contaminants of Concern: Diesel, MTBE / TBA / Other Fuel Oxygenates, Gasoline
Site History: Underground storage tank (UST) system upgrade activities were performed in January 2003 at the 3-acre site, a commercial truck leasing, maintenance, repair, and fuel facility. Two USTs, one with a capacity of 12,000 gallons that contains diesel and one containing gasoline with a 10,000-gallon capacity, are included in the system and remain in service. The existing fuel dispensers and product piping were removed and replaced during the upgrade activities. Analyses of soil samples collected from beneath the existing fuel dispensers and piping indicated that an unauthorized release of diesel and gasoline had occurred. The maximum detected diesel concentration in the soil samples was 3,400 milligrams per kilogram (mg/kg). Gasoline was detected at a maximum concentration of 170 mg/kg. Based on the soil sample analytical results, DEH Case #H04771-001 was opened on January 27, 2003. Approximately 40 tons of diesel-impacted soil was subsequently excavated from beneath product piping and the dispensers and treated offsite. Site assessment activities were initiated in March 2004 by Frey Environmental, Inc. (Frey) with the advancement and sampling of four borings to a depth of 20 feet below ground surface (bgs). Groundwater was encountered in the borings at approximately 18 feet bgs. Diesel was detected in soil samples collected at a depth of 15 feet bgs, while gasoline was detected in one sample collected at the same depth. The maximum detected concentrations of diesel and gasoline in the samples were 370 and 19 mg/kg, respectively. The aromatic hydrocarbons (benzene, toluene, ethylbenzene, and xylene [BTEX]) and fuel oxygenates (including methyl-tert-butyl ether [MTBE]) were not detected in the soil samples. Based on the soil sample results, Frey estimates the volume of impacted soil remaining in place to be less than five cubic yards. During the March 2004 investigation, one groundwater grab

RYDER TRUCK RENTAL LC-1093 (Continued) **S108219023**

sample was collected from each boring. Diesel was detected in two groundwater grab samples and MTBE was detected in each of the four samples, indicating that groundwater was impacted by the unauthorized release. Gasoline, the aromatic hydrocarbons, and the remaining fuel oxygenates were not detected in the groundwater grab samples. Seven on-site groundwater monitoring wells and two off-site wells were subsequently installed in association with site assessment activities performed in 2004, 2005, and 2009. Based on water level measurements, Frey has determined the groundwater flow direction to be to the south-southwest. Analytical results reported for 2004 through 2006 indicated the detection of diesel, gasoline, BTEX, MTBE, tert-butyl alcohol (TBA) and tert amyl ethyl ether (TAME) in groundwater samples collected from one or more of the six existing wells. However, results for samples collected since 2007 indicate that BTEX and TAME are no longer chemicals of concern (COCs) for groundwater. Analytical results reported for the most recent monitoring and sampling round, performed in June 2011, indicate continued detection of diesel, gasoline, and TBA in the sample collected from one well located in the source area. MTBE was detected in samples collected from four of the wells at a maximum concentration of 21 micrograms per liter (a%g/l). MTBE and TBA are thus the remaining COCs for site groundwater. Inquiries made by Frey to the City of Escondido confirmed that drinking water for the municipality is imported. Escondido Creek, a concrete-lined drainage, is located approximately 410 feet south of the site. Frey prepared trend analyses using the analytical data for samples collected from two wells with the highest historical concentrations of MTBE through December 2010. Based on linear regression calculations, it was estimated that 10.7 to 11.6 years would be required for MTBE concentrations to fall below its Secondary MCL of 5 a%g/l. Frey also calculated approximately 15 years as the minimum time required forMTBE to reach Escondido Creek. Thus, Frey concluded that MTBE will naturally attenuate to 5 a%g/l in less time than it would take to reach Escondido Creek. A revised Corrective Action Plan (CAP) was submitted to DEH in May 2011 that recommended soil and groundwater remediation by natural attenuation. The revised CAP received final concurrence on August 4, 2011. Based on low volume of impacted soil remaining in place, the minimal detection of volatile organic compounds in groundwater, and the negligible risk to human and environmental receptors, Frey has recommended no further action and case closure. DEH concurs with these recommendations.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No

ESCONDIDO PLATING INC (Continued) **1001085644**

Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

. Waste code: 121
. Waste name: Alkaline solution (pH >12.5) with metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc)

. Waste code: 132
. Waste name: Aqueous solution w/metals (< restricted levels and see waste code 121 for a list of metals)

. Waste code: 135
. Waste name: Unspecified aqueous solution

. Waste code: 723
. Waste name: Liquids with chromium (VI) > 500 mg/l

. Waste code: 792
. Waste name: Liquids with pH < 2 with metals

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D003
. Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

. Waste code: D006
. Waste name: CADMIUM

. Waste code: D007
. Waste name: CHROMIUM

. Waste code: F006
. Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS)

ESCONDIDO PLATING INC (Continued) **1001085644**

ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

FINDS:

Registry ID: 110002910397

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

HAZARDOUS AIR POLLUTANT MAJOR

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

File Location:	Local Agency
Local Case Number:	210526-001
Potential Media Affect:	Soil
Potential Contaminants of Concern:	Waste Oil / Motor / Hydraulic / Lubricating
Site History:	A 550-gallon capacity, underground storage tank (UST) was removed from the property at 1122 West Valley Parkway in Escondido, California, on May 5, 2009. A motor oil servicing shop presently occupies the property. Decomposed granitic bedrock was encountered at the base of the UST excavation at a depth of approximately 10 feet below ground surface (bgs). The County inspector observed petroleum hydrocarbon staining at the base of the excavation. Analytical

A & D BOYD LLC (Continued) **S100861118**

results for a soil sample collected during the UST removal indicated a motor oil concentration of 5,560 milligrams per kilogram (mg/kg). In January 2010, Giles Engineering Associates, Inc. (Giles) performed a preliminary site assessment in the vicinity of the former UST excavation. Six borings were advanced and sampled to a maximum depth of 35 feet bgs. Photoionization detector measurements of the soil samples did not exceed background levels. The deepest boring was converted to a groundwater monitoring well. Analytical results for soil samples collected from the borings. Petroleum hydrocarbons were detected in the samples as motor oil. The maximum detected motor oil concentration in the samples was 470 mg/kg. No aromatic hydrocarbons, volatile organic compounds, or fuel oxygenates were detected in the soil samples. The vertical extent of motor impacts was approximately 12 feet bgs. Giles estimated the volume of impacted soil at the site as 180 cubic yards. Groundwater was not detected in the monitoring well after its installation. Subsequent checks through March 18, 2010, have confirmed that the well is dry.

MOBIL 18-100 (Continued) **S109277051**

Local Case Number: H05484-004
Potential Media Affect: Aquifer used for drinking water supply
Potential Contaminants of Concern: Gasoline
Site History: On 3 October 1997, a damaged valve under the eastern gasoline dispenser resulted in the release of approximately four gallons of gasoline. An unauthorized release report was submitted to the DEH on 7 October 1997 summarizing the incident and detailing the repair of the valve. An unauthorized release case was subsequently opened by the DEH on 4 August 1998. On 27 August 1998, station upgrade activities were performed at the site. Two hand auger soil borings (HA3 and HA4) were advanced in the vicinity of the eastern dispenser island. Soil samples from soil boring HA3 were collected at depths of 4, 9, and 15 feet below ground surface (bgs) and analyzed for Total Petroleum Hydrocarbons as gasoline and diesel (TPH-g and TPHd), benzene, toluene, ethylbenzene, and total xylenes, (BTEX), and methyl tertiary butyl ether (MTBE). The maximum concentration of TPH-g was 12,000 milligrams per kilogram (mg/kg) at 9 feet bgs. The maximum concentrations of TPH-d, benzene, and MTBE were 6,000 mg/kg, 18 mg/kg, and 69 mg/kg, respectively, at 15 feet bgs. No soil samples were analyzed from soil boring HA4. On 17 November 1999, soil borings (B-1, MW-1, and MW-2) were advanced at the site. Soil borings MW-1 and MW-2 were converted into groundwater monitoring wells. Maximum concentrations of TPH-g and TPH-d in soil samples analyzed from the borings were 3,500 mg/kg and 1,600 mg/kg, respectively, from MW-1 at 10 feet bgs. MTBE concentrations ranged from ND to 4.7 mg/kg (B-1 at 10 feet bgs). Benzene concentrations were not detected above the laboratory reporting limits in any soil samples. During the advancement of the soil boring MW-3, a diesel product line was encountered at 4 feet bgs. The line was damaged releasing approximately one gallon of diesel product into the subsurface. On 18 November 1999, at the request of the DEH, one soil boring (PD) was advanced below the damaged diesel product pipe. Soil samples were collected at depths of approximately 6, 9, and 11 feet bgs. TPH-g concentrations in soil samples ranged from 2.1 mg/kg (11 feet bgs) to 2,500 mg/kg (6 feet bgs). Maximum TPH-d concentration was 7,500 mg/kg at 6 feet bgs. One soil sample (PD-1/6), was analyzed for MTBE, and a concentration of 0.44 mg/kg was detected. On 31 May and 1 June 2000, three soil borings (B-1A, B-2, and MW-3) were advanced to depths of approximately 15, 15, and 25 feet bgs, respectively. Soil boring MW-3 was moved from its original location where the diesel product pipe was damaged to 20 feet south. Maximum TPH-g and TPH-d concentrations were 7,000 mg/kg and 3,300 mg/kg, respectively, in soil boring B-2 at 11 feet bgs. Maximum MTBE and benzene concentrations were 47 mg/kg and 3.8 mg/kg, respectively, in soil boring B-2 at 13. In a letter dated 11 December 2000, the DEH classified the site as Priority A and requested a work plan to further assess the extent of MTBE. On 11 and 12 July 2001, four additional groundwater monitoring wells (MW-4 through MW-9) were installed. Seventeen soil samples were collected and submitted for analyses. The maximum TPH-g concentration was 1.3 mg/kg from soil boring MW-5 at 15 feet bgs. The maximum MTBE concentration was 110 mg/kg in soil boring MW-9 at 10 feet bgs. Benzene concentrations were not detected above the laboratory reporting limits in any soil samples. In August 2001, a 24-hour dual-phase extraction (DPE) test was conducted using wells MW-1, MW-2, MW-3, and MW-5. Approximately 97.47 pounds of hydrocarbon vapors and 4,800 gallons of groundwater were recovered during the test. A radius of influence of 92 feet was calculated from the DPE

MOBIL 18-100 (Continued) **S109277051**

test data. Based on the results, TRC concluded that DPE appeared to be a feasible remedial option for hydrocarbon remediation in soil; however, effectiveness with respect to groundwater remediation was inconclusive. Drawdown due to DPE operation was not reported. On 8 February 2002, the service station was closed and a chain-linked fence was placed around the perimeter. On 15 and 16 July 2002, two additional groundwater monitoring wells (MW-10 and MW-11) were installed south and west of the site. In addition, monitoring well MW-4 was abandoned per regulatory standards. Well MW-10 was located along the southern border of the site, and was installed in the backfill of an upper storm drain lateral along West Mission Avenue. The upper lateral was above the groundwater interface and was therefore not considered a conduit for migration. Well MW-11 was located east of Reidy Canyon Creek, and was installed in the backfill of the lower storm drain that intersects groundwater and could be a potential conduit for migration. Laboratory analytical results from soil samples indicated TPH-g, TPH-d, BTEX, and MTBE concentrations were below the laboratory reporting limits. Based on the detection of dissolved-phase concentrations of TPH-g and MTBE in the initial samples from wells MW-10 and MW-11, additional assessment was recommended to the north, south, and west of MW-10. The DEH accepted TRCs recommendation and stated a CAP would be required once MTBE was fully delineated. From 7 to 21 May 2003, service station divestment activities were performed at site. Demolition included the removal of three gasoline USTs, one diesel UST, all associated product piping and vent lines, three gasoline dispensers, and one diesel dispenser. Soil sample analytical results indicate elevated concentrations of petroleum hydrocarbons in the vicinity of the dispenser islands and product piping. Approximately 92 tons of soil generated during the excavation of the product piping was removed and transported to TPS Technologies for disposal. In November 2003, two groundwater monitoring wells (MW-12 and MW-13) were installed and surface water samples (CK-1, CK-2, and SD-1) and were collected from Reidy Creek. TPH-g, TPH-d, and MTBE concentrations were not detected in soil samples above the laboratory reporting limits. Benzene was detected at a concentration of 0.0064 mg/kg in soil boring MW-13 at 12.5 feet bgs. Initial groundwater and surface water sample analytical results indicated an MTBE concentration of 3.3 micrograms per liter ("g/L) detected in well MW-12 and TPH-d concentration of 198 "g/L in surface water sample CK-2. Benzene and TPH-g were not detected above the laboratory reporting limits in the initial groundwater samples from MW-12 and MW-13 or the surface water samples. From June through August 2006, monthly surface water (CK-1 through CK-3), storm drain (SD-1 through SD-6), and groundwater (MW-5, MW-10, and MW-11) samples were collected and analyzed to assess concentrations of dissolved-phase MTBE. Sample locations CK-3 (an unlined culvert) and SD-1 though SD-5 were dry during all three sampling events. Location SD-6 was sampled on 20 June, 27 July and 17 August 2006. Concentrations of TPH-g, TPH-d, BTEX, TBA, DIPE, TAME, and ETBE were not detected during any of the sampling events. Concentrations of MTBE detected in the upstream (CK-1) and downstream (CK-3) surface water samples from Reidy Canyon Creek were consistent with minor dissolved-phase MTBE concentrations in other large bodies of water in southern California. On September 5, 2008 a CAP was submitted by ETIC. In a letter dated December 9, 2008, the DEH requested additional water sampling be conducted and revisions to the CAP. Revised CAP submitted 2/18/2009 by ETIC. Telcon 6/11/2009 with ETIC

MOBIL 18-100 (Continued) **S109277051**

the DEH requested a hard copy of the 1st quarter 2009 GW report be submitted and a revised Table 3 for the CAP. July 7, 2009 1st Quarter 2009 GW report submitted to the DEH. August 14, 2009 amendments to the CAP submitted to the DEH.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 11/12/2018

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Northeast Map:	5640948 VALLEY CENTER, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

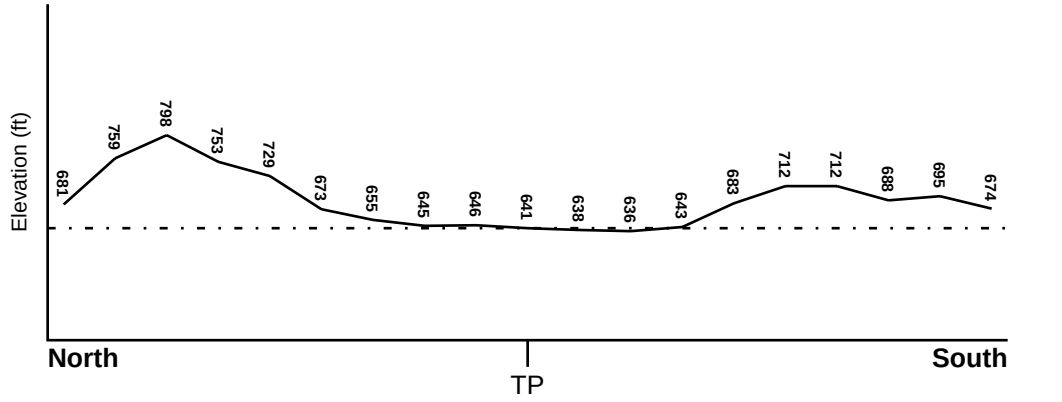
TOPOGRAPHIC INFORMATION

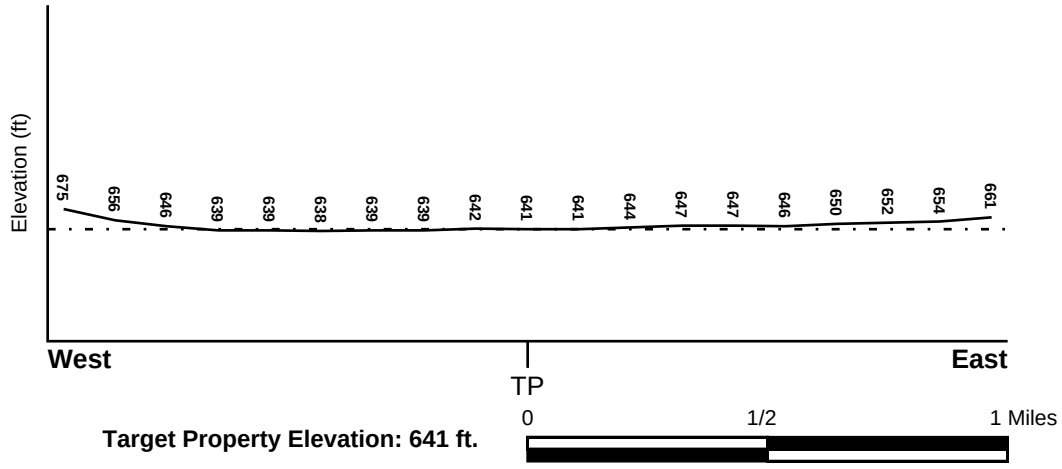
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 641 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06073C1076G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06073C0813G	FEMA FIRM Flood data

06073C1077G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
ESCONDIDO	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/2 - 1 Mile ESE
Site Name:	Chatham Bros
Site EPA ID Number:	CAD990663361
Groundwater Flow Direction:	Southeast
Measured Depth to Water:	0.5 foot.
Hydraulic Connection:	Information about the hydraulic connection between aquifers under the site is not available.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information based on site-specific subsurface investigations is documented in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

10G	1/2 - 1 Mile SE	S

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: VISALIA

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	11 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 6.5 Min: 6.1
2	11 inches	40 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 6.5 Min: 6.1
3	40 inches	59 inches	very fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 6.5 Min: 6.1

Soil Map ID: 2

Soil Component Name: RAMONA

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 4 Min: 1.4	Max: 7.3 Min: 6.6
2	16 inches	59 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 4 Min: 1.4	Max: 7.3 Min: 6.6
3	59 inches	74 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 4 Min: 1.4	Max: 7.3 Min: 6.6

Soil Map ID: 3

Soil Component Name: PLACENTIA

Soil Surface Texture: sandy loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Moderately well drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	12 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 0.42 Min: 0.01	Max: 8.4 Min: 7.9
2	12 inches	33 inches	sandy clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 0.42 Min: 0.01	Max: 8.4 Min: 7.9
3	33 inches	62 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 0.42 Min: 0.01	Max: 8.4 Min: 7.9

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon
Source: Department of Public Health
Telephone: 916-210-8558
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Ninyo & Moore were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OR DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction orforecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1903 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 1320 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

VOLUNTARY ASSISTANCE PROGRAM
APPLICATION FOR ASSISTANCE

(PLEASE READ BOTH PAGES OF THIS APPLICATION PRIOR TO COMPLETION)

A. Site Name Escondido Public Works Yard - Western Yard — Assessors Parcel Number 232-090-72-00

Site Address 901 West Washington Street, Escondido, CA 92025
(Please include Street, City, State, and Zip Code)

B. Application Submitted By:

Contact Person Walter B. Craig — Telephone 619-546-7165 — Fax 619-546-7175

Company Name BBC Environmental, Inc. — E-mail Address w.craig@bbcenvironmental.com

Mailing Address 3593 Adams Avenue, San Diego, CA 92116
(Please include Street, City, State, and Zip Code)

Notes: 1. Applicant is responsible for payment to the County. Invoices will be sent to the applicant at this address unless other arrangements are made.
2. DEH requires all applicants to electronically upload all reports and work plans to the State Water Resources Control Board's GeoTracker database.

C. Property Owner* City of Escondido
Charles Grimm, Asst. City Manager — Signature
Telephone 760-839-4621 — E-mail Address cgrimm@escondido.org

Mailing Address 201 N. Broadway, Escondido, CA 92025
(Please include Street, City, State, and Zip Code)

*** Note: Property Owners have the ultimate responsibility to ensure that all environmental issues associated with their property are resolved in accordance with all applicable standards, guidelines, and regulations.**

D. Brief project description and type of assistance requested: Phase 2 Assessment Review - NFA Concurrence

E. Do you foresee your project cost to be higher than $1,000,000.00?

X No
Yes

If yes, have you completed a CEQA report? No Yes — Has public notification been conducted? No Yes

I accept the application requirements and project review conditions listed on Page 2 of 2 and I agree to pay all costs associated with DEH staff time and services within 30 days of receiving an invoice.

VOLUNTARY ASSISTANCE PROGRAM # DEH2014-LSAM-000231
ESCONDIDO WESTERN PUBLIC WORKS YARD
901 W. WASHINGTON ST., ESCONDIDO, CA

The Department of Environmental Health (DEH), Site Assessment and Mitigation Program (SAM), reviewed the environmental investigation report related to the above-referenced property, prepared by BBC Environmental, Inc., on March 15, 2013. The report summarizes the site investigation activities performed at the above-referenced location. Provided that the information presented to DEH was complete, accurate, and representative of existing site conditions, **this agency concurs that the cleanup goals established for the subject site have been met.**

Please be advised that this letter does not relieve the responsible party of any liability under the California Health and Safety Code or the Porter Cologne Water Quality Control Act. If previously unidentified contamination is discovered which may affect public health, safety and/or water quality, additional site assessment and cleanup may be necessary.

The DEH understands that the present land use for the Site is a commercial property. Changes to this land use may require reassessment of the property to determine if the revised land use could result in a risk to public health.

Thank you for selecting the DEH as your lead agency to assist you with the progress of your environmental project. Please contact Laurie Apecechea of SAM, at (858) 505-6993, if you require additional assistance.

Sincerely,

COLLEEN HINES, Program Manager
Supervising Environmental Health Specialist
Site Assessment and Mitigation Program

II. CASE INFORMATION

Case No. DEH2014-LSAM-000231	RWQCB Case No. N/A
Site Name: Escondido Western Public Works Yard	SITE ADDRESS: 901 West Washington St., Escondido 92025

Property Owner	Address	Phone Number
City of Escondido c/o Charles Grimm, Asst. City Manager	201 N. Broadway, Escondido, CA 92025	(760) 839-4621

Requesting Party	Address	Phone Number
(Same as above)		

Agency notification of DEH Oversight: DTSC: 2/12/2014 RWQCB: 2/12/2014

III. SITE CHARACTERIZATION AND/OR INFORMATION

Purpose of Investigation: Assess potential impacts of facility operations to soil and groundwater.		Substances Investigated: Petroleum Hydrocarbons, Volatile Organic Compounds, Metals, and Polychlorinated Biphenyls	
Site Characterization complete? Yes			
Monitoring Wells Installed? No	Total Number: N/A	Proper Screened Interval? N/A	Number of decommissioned wells: N/A
Depth to groundwater beneath site? 13 to 22 Feet (Estimated)		Groundwater Flow Direction: Southeast (Estimated)	
Most Sensitive Current Use: Groundwater – MUN, AGR, IND, SUP Surface Water – MUN, AGR, REC1, REC2,			
Are Drinking Water Wells Affected? No		RWQCB Basin Number: 904.62 – Escondido Hydrologic Sub-area	
Is Surface Water Affected? No		Nearest Surface Water Name: Reidy Creek, (50 feet to SE)	
Off-Site Beneficial Use Impacts (addresses/locations): None			

TREATMENT AND DISPOSAL OF AFFECTED MATERIAL

Material	Amount (Include Units)	Action (Treatment or Disposal)	Date
None			

Non-LOP - Underground Storage Tank Oversight handled outside the LOP

MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS	MAXIMUM	REMAINING
SOIL

Zinc	= 5,200 µg/l	= 5,200 µg/l

* Water samples collected from borings

Case Closure Summary
Non-LOP or Voluntary Assistance Program

III. SITE CHARACTERIZATION AND/OR INFORMATION (Continued) DEH2014-LSAM-000231

COMMENTS: Voluntary Assistance Program case, DEH2014-LSAM-000231, was opened to review a Phase 2 site assessment report for future site development at the subject site. The subject property is located mid-block on the south side of West Washington Avenue between Metcalf Street and North Spruce Street in Escondido. The site is currently operating as a public works storage yard for materials, aggregate and equipment. The site also acts as a heavy equipment training area for City employees. Historical records and aerial photographs reveal the prior presence of a railroad wye rail. The site is bounded on the east by Palomar Transit Mix and to the southeast by the Reidy Creek storm drain channel. The subject site had a previous release under the oversight of the Department of Environmental Health (DEH), listed as case H20272-003. This case was opened following the discovery of shallow soil impacts of total petroleum hydrocarbons (TPH) within an unlined drainage ditch. The origin of the contamination found at the site was noted to be from the Palomar Ready Mix facility located east of the site. The case was closed by DEH on August 26, 1991, following excavation of approximately 22 cubic yards of impacted soil.

The recent site assessment report (SAR) dated March 15, 2013, submitted to DEH for case DEH2014-LSAM-000231 discusses the prior DEH case regarding the soil excavation in 1991, and lists the amount removed as 70 cubic yards, which is a different volume that was listed in the DEH closure. The most recent fieldwork presented in the 2013 SAR was conducted in November 2010, and again in April 2012. The investigation conducted in November 2010, included the installation of twelve direct push soil borings (SB-1 through SB-12) in various areas on site, including the former drainage ditch and current storm drain culverts. Soil and groundwater samples were obtained from each boring. The soil laboratory analytical results indicated total petroleum hydrocarbons (TPH) in the diesel and motor oil range in the samples from the soil borings advanced along the former drainage ditch. Groundwater sample results were mostly nondetect, except for low concentrations of Methly-tert-butylether (MTBE) and Tetrachloroethene (PCE). Additionally, three grab groundwater samples were obtained earlier in October 2010 during the advancement of geotechnical borings and one of those samples contained MTBE.

The second investigation included the installation of four additional direct push borings (SB-13 through SB-16) to define the dissolved MTBE contamination found during the initial investigation. The 2012 groundwater analytical results were all nondetect for MTBE, but all samples contained similar concentrations of PCE. Since the MTBE in groundwater was delineated by the second phase of work, the soil samples obtained were not analyzed.

The conclusions in the SAR are the location of the former excavation for DEH case H20272-003, most likely extended into the locations of soil borings SB-2 and SB-3 installed in November 2010. SB-3-15 was most likely taken below the 1991 remedial excavation. The vertical delineation of the shallow soil impacts observed at SB-2-5 suggests it is limited. The absence of TPH in groundwater beneath the two sample locations supports the conclusion that impacts are minor. The low concentrations of MTBE reported appear to be limited to the northwestern portion of the site and are fully delineated. No onsite soil MTBE source has been detected and the estimated MTBE mass was calculated to be approximately 0.018 kg. The low levels of PCE in groundwater at the site are similar to other DEH sites located in the area. The absence of PCE in the soil suggests that the dissolved PCE concentrations are regional and possibly for an off-site source. Naturally occurring metals in both soil and groundwater are present at the site, but also seem regional in nature. The consultant has concluded that no further assessment is necessary, and DEH concurs with the recommendation.

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? No, the dissolved MTBE and PCE concentrations are slightly above the MCL, but appear to be associated with regional off-site impacts reported in the general area.
Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Yes
Does corrective action protect public health for current land use? Yes Case review based on current use as: Commercial – possible redevelopment
Are there other issues DEH needs to follow up on: No
Site Management Requirements: Any contaminated soil excavated as part of subsurface construction work must be managed in accordance with the legal requirements at that time.
Should corrective action be reviewed if land use changes? Yes
List Enforcement Actions Taken: None
List Enforcement Actions Rescinded: N/A
Is this account up to date and current? Yes

V. LOCAL AGENCY REPRESENTATIVE DATA

Subject: RE: LSAM2-14-LSAM-000131: Escondido Western Public Works Yard

At this time, we do not. It is currently an overflow storage lot for the Public Works unit. This lot was going to be incorporated into the new Padre's ballpark for their AA affiliate relocating from Portland, OR. But when the Governor dissolved all the RDC's and took away the money, this project stalled. The City is courting large commercial tenants, but I do not know of any takers just yet.

Hope that helps, -w.

Hi Craig:

My email must have been sent a while ago, as I don't remember why I used the reference LSAM-000131? I see SAM people before me used that title? Anyhow...here is what I learned...There is no LSAM-000131 either in our county database or in GeoTracker. LSAM-000231 is the case for Escondido Western Public Works Yard at 901 W. Washington Street. I did see that there was money in the trust account about a month or so ago and I am pretty much done with the Closure Summary. If you will verify if the contact I have is correct, I will initiate the closure process.

Subject: FW: LSAM2-14-LSAM-000131: Escondido Western Public Works Yard

Hi Laurie.

I am coming back around to your inquiry on the LSAM-000131 case opened through the VAP program with Nasser. I believe it is one and the same as LSAM-000231 found on GeoTracker (T10000005649) - if actually for the Western Public Works Yard. Note that the Reference line in the emails from Carol and Ewan all reference LSAM-000131.

In the email string attached, you can see that BBC on behalf of the City of Escondido had requested concurrence on a no further action recommendation for the 901 W. Washington Ave site. Ewan had agreed with the NFA recommendation, but there appeared to be an outstanding amount due to the County for review services. Attached you will see the screen shot that shows the City of Escondido paid the $355 due in January, and also paid the renewal for VAP services ($1,420) in February.

With the balance being paid, I believe the City of Escondido is awaiting the concurrence letter for the NFA recommendation. Which we would still like to get for their files. This might also explain why a County file may not be found.

Let me know if you think this might explain your findings. And if so, I'd respectfully request that a concurrence letter be issued so our client can have some closure as well.

Give me a call with any questions, -w.

Good Morning Walt:

This case got transferred to me last summer and we can't find a file for it....SIGH! There isn't much in GeoTracker, but there was time charged against the case for preparing a closure. Do you know if this case did get closed? I believe Nasser had it towards the end of 2014. Any information you have will help.

Thanks for your time,

Walter,
The City paid the outstanding balance on 1/20/15 and deposit amount on 2/4/15. Could you please follow up with the County to issue the NFA determination?
We can pay for the associated time as a part of the current contract.
Thank you,
Julie

Subject: FW: LSAM2-14-LSAM-000131: Escondido Western Public Works Yard

Hi Bud, Hi Julie:

At the end of the year I was following up on the formal No Further Action (NFA) determination by the County of San Diego, DEH on your Western Yard project that we submitted. They had previously indicated that they were in agreement with our conclusion that no further action was required on this property. It came to my attention that the County had sent in to Escondido 2 invoices that had not been paid. See the attached. You will note that they did not send them to the City to anyone person's attention. The outstanding amount due is $355.00.

Also on this invoice you will see a Deposit Amount for $1,420.00. This is the standard, annual deposit that is typically made to engage the VAP (Voluntary Assistance Program) for their assistance. In order to get your NFA letter issued, Escondido will want to pay this deposit amount also. Then, the VAP will issue you your NFA Letter for your/our files. It might cost a couple hundred dollars to get the letter, but the balance will be returned to Escondido upon closing out the project file. I believe it is a formal letter that you ought to have going forward for your protection.

Let me know how you would like to proceed. You can handle this directly with the VAP if you choose to. I would ask that you please keep me in the loop so that I can retain a copy of the NFA letter and close out my project files as well. If need be, I can arrange for the payment and bill the City of Escondido if that makes any sense to do. I would just need to know if you want me to handle this on our current budget line, or some other.

Thanks, -w.

Walter

It is pretty much ready to be done; however, we will need payment prior to issuance of letter. An invoice was sent to the client. Essentially $355 is due. In addition an additional $1420 (10 hours work) will need to be submitted to deposit account for work yet to be done (pretty much compilation and submittal of NFA letter). As very little time is needed for that, the client will most likely get the majority of the $1420 refunded back.

As mentioned, an invoice was sent to the client (City of Escondido) so they should be aware of this money due. With that done, the letter will go out.

Regards

Ewan

Hi Ewan. As we approach the end of the year, I wanted to follow-up on the determination for No Further Action on this VAP case. Was a formal letter ever issued from the County of San Diego stating their concurrence with our NFA request? If so, my office did not receive one and we would like one for our files so we can close this project out.

Please let me know the current project status.

Thanks, -w.

Hi Ewan.

I have a VAP case that I believe made its way to you from Carol Fenner. The City of Escondido is looking for concurrence on a recommendation for no further action that we have made on one of their public works properties.

Have you had a chance to review the case as of yet?

Let me know, Thanks, -w.

Subject: LSAM2-14-LSAM-000131: Escondido Western Public Works Yard

Hi, Craig,

How are you doing? This is a reminder to upload the SAR for this VAP case to GeoTracker.

Hope the RWQCB is making some progress on the other site!

1.0 INTRODUCTION

BBC Environmental, Inc. (BBC) was retained by the City of Escondido (Escondido) to oversee the performance of limited environmental site assessments beneath the site located at 901 West Washington Avenue in Escondido, California (site)(Figure 1; Site Vicinity Map and Figure 2; Site Map). These site characterization activities were requested in an effort to assess environmental impacts that may need to be considered prior to potential site development projects. The purpose of this scope of work is to determine if potential soil and/or groundwater impacts are present at depth beneath the site as a result of facility operations.

BBC performed two assessment events in total. The first assessment event was conducted on November 22nd and 23rd, 2010 at which time twelve direct-push borings were installed and both soil and groundwater samples were collected and analyzed. Findings from the November 2010 event included the detections of low-level methyl tertiary butyl ether (MTBE) and tetrachloroethene (PCE) impacts to groundwater in the northwestern portion of the site. The second assessment event was conducted on April 25th, 2012 during which four additional direct-push borings were installed in an effort to delineate the low-level MTBE impacts beneath the site. PCE data was also collected from groundwater sample analyses performed during the second assessment event; however, observations suggest that PCE impacts to groundwater in the site vicinity are likely a regional problem and not the direct result of site operations. The line of evidence supporting PCE impacts to groundwater being a regional problem is presented in Section 7.0 of this report.

Following a brief site and area background description, evaluations of site conditions are then provided using the results of the two most recent investigations in combination with the prior historical data. Findings, conclusions, and a recommendation for no further action are made at the end of this report.

2.0 SITE BACKGROUND

The site background, including historical activities at the site is summarized in this report section. The bibliography at the end of this report provides specific references.

2.1 SITE LOCATION AND PROPERTY OWNERSHIP

The subject property is currently identified as:

Western Public Works Yard
901 W. Washington Avenue
Escondido, CA. 92025

The County of San Diego Assessor's Office has assigned the subject property Assessor Parcel Number (APN) 230-090-72.

The subject property is currently owned by:

City of Escondido
201 N. Broadway
Escondido, CA. 92025

Historical records indicate that Nachant Environmental, Inc. (NEI) was contracted by the North County Transit District (NCTD) to perform a preliminary site assessment on a 16 acre parcel (that included the subject property) prior to NCTD purchasing the property. The preliminary site assessment was performed in December 1990 and NCTD subsequently purchased the parcel in approximately January 1991 (NEI, 1990). As part of this NCTD purchase, a portion of the

parcel purchased by NCTD was sold to the City of Escondido. The property acquired by the City of Escondido is the subject site of this investigation.

The subject property is located mid-block on the south side of West Washington Avenue between Metcalf Street and North Spruce Street in Escondido, California (Figure 1). The site is commonly referred to as the Western yard of the Public Works facility. The site is currently operating as a public works storage yard for materials, aggregate, and equipment. The site also acts as a heavy equipment training area for City employees. Three temporary structures used as field operation offices and storage are located in the northeastern portion of the parcel (Figure 2). Stockpiles of soils, aggregate, and materials are present centrally on the property, and in segregated staging areas along the eastern boundary. Salvaged and recyclable equipment including potential asbestos containing materials (ACMs) and electrical components were observed along the southwest property line.

Historical site records and aerial photographs reveal the prior presence of a railroad wye rail. The wye rail is a triangular arrangement of track that was used to turn trains around. The wye rail was observed during NEI site assessment activities in December 1990 (NEI, 1990) but was not observed at the site during these most recent investigations.

The site is bounded on the east by Palomar Transit Mix and to the southeast by the Reidy Creek storm drain channel. Across Reidy Creek storm channel to the southeast is the Eastern yard of the Public Works facility. The properties are accessible from one another via a bridge over Reidy Creek. To the south and southwest, the site is bounded by the Inland Rail Trail and the Sprinter Rail operations. To the west, the site is bounded by Bombardier Transportation providing fleet maintenance to the Sprinter rail. And across West Washington Avenue to the north are commercial and industrial businesses including John Deere Landscape and Escondido Disposal, Inc.

The County of San Diego Department of Environmental Health, Land and Water Quality Division, Site Assessment and Mitigation Program (SAM) has previously assigned the subject property Unauthorized Release Number H20272-003. The case was opened following the discovery of shallow soil impacts of TPH within an unlined drainage ditch. The ditch reportedly provided site drainage from the northeast to southwest across the property. The case was closed by the California Regional Water Quality Control Board-San Diego Region (CRWQCB) and SAM on August 26, 1991 following a shallow soils excavation of approximately 70 cubic yards. Further discussion of prior environmental assessment activities is provided in Section 3.0. A copy of the closure letter and case closure summary are presented in Appendix A. NEI reports are listed in Section 12, Bibliography of this report.

3.0 RELEASE DESCRIPTION AND PRIOR ENVIRONMENTAL ASSESSMENT

A review of historical site records available at SAM and through available database queries revealed one unauthorized release report (URR) assigned to the site. The URR was generated following the NEI site survey visit performed on December 4, 1990. During the site visit, NEI personnel observed a site drainage ditch receiving runoff from the adjacent Palomar Transit Mix facility. The runoff water in the ditch was noted to have a, "…solvent and/or hydrocarbon odor." (NEI, 1990). One soil sample from shallow soils beneath the "sludge" was sampled, analyzed, and found to contain Total Petroleum Hydrocarbons (TPH) in the diesel range above recognized SAM action levels.

NEI recommended and performed shallow soil and groundwater sampling including the installation of six soil borings and the collection of 5 groundwater samples at the NCTD site. Only a portion of this work (borings B-1, B-2, and B-3, and a single soil sample from the drainage ditch) appears to have been performed on the property that is currently the Western yard (NEI, 1990). Soil and groundwater samples were analyzed for the presence of petroleum products. Laboratory analytical results indicated that no detectable concentrations of TPH were reported above laboratory detection limits, with the exception of the one soil sample collected from the drainage ditch on the subject property.

In January and February of 1991, a total of 21 soil samples were collected from the site drainage ditch (NEI, 1999a). TPH impacts as high as 392 milligrams per kilogram (mg/kg) and TRPH impacts as high as 4,590 mg/kg were reported in these shallow soil samples. A limited remedial excavation was performed in April 1991. The excavation removed suspect soils from the drainage ditch to a depth not exceeding 4.5 feet below ground surface (bgs). The excavation was estimated to be approximately 415 feet in length as measured from the common border with the Palomar Ready Mix property (NEI, 1991b). Approximately 70 cubic yards of soil were removed from the ditch. And in May 1991 the remaining stockpiled soils were transported and disposed of at the Sycamore Landfill.

In June 1991, NEI petitioned for case closure stating that no further environmental assessment actions appeared necessary. And on August 26, 1991 SAM and the RWQCB concurred and issued their administrative closure for the case.

4.0 GEOLOGY AND HYDROLOGY

The surface geology at this site is depicted on published geologic maps as older alluvial flood plain surficial deposits. These sedimentary units are moderately well consolidated, poorly sorted, permeable flood plain deposits of the Pleistocene Epoch of the Quaternary Period (USGS, 1999). Surrounding elevated areas consist of granitic bedrock of the Cretaceous Period.

As reported in boring logs prepared during the two BBC assessment events and previous investigations, geologic materials beneath the site consist of silty and clayey fine to medium sands overlying decomposed granitic rock. Boring logs from a geotechnical investigation performed by Geocon Consultants in October 2010 identify weathered granitic rock occurring onsite between 19 and 25 feet bgs (Geocon, 2010). Refusal was encountered during the BBC direct-push investigations at locations SB-5 (~18 feet bgs) and SB-6 (~17 feet bgs) in the southeastern portion of the site, and again at location SB-13 (~18 feet bgs) in the northwestern portion of the site. All other direct-push locations were successfully extended to a total depth of approximately 20 – 22.5 feet bgs.

Groundwater beneath the site has been mapped by the California Regional Water Quality Control Board (CRWQCB) to be located in the Escondido Hydrologic Subarea of the Escondido Creek Hydrologic Area of the Carlsbad Hydrologic Unit and is identified by the Hydrologic Unit Basin Number 904.62 (CRWQCB, 1994). The CRWQCB has determined that groundwater beneath the site has existing beneficial uses including municipal, agricultural, and industrial service supply. Near site groundwater monitoring wells have reported depths to first groundwater as shallow as 13 feet bgs. Groundwater was encountered during BBC assessment activities from approximately 13 to 22 feet bgs.

Since no permanent groundwater wells were installed, a calculated groundwater gradient is not available at this time. However, the site proximity to both the Reidy Creek storm drain channel and the Escondido Creek storm drain channel suggests that groundwater flow in the area may range in direction from southeast to southwest. The site is bounded by Reidy Creek to the southeast. Escondido Creek is located south of the adjacent Sprinter Rail operations. The confluence of the two storm drain channels lies to the south and we have estimated the groundwater flow direction to be towards the confluence for the purposes of this report (Figure 3 and Figure 4).

DWR records indicate that groundwater quality in the Basin is generally sodium chloride in type, with subordinate amounts of magnesium, calcium, bicarbonate, and nitrate ions. Total dissolved solids (TDS) content ranges from 250 milligrams per liter (mg/L) to more than 5,000 mg/L. Local sources of groundwater in the Basin are categorized as suitable to inferior for domestic use. The water categorized as inferior typically contains high nitrate, TDS, or sulfate content (DWR, 1967).

Reidy Creek's flow path is concrete lined acting as a storm water channel to its intersection with State Highway 78 approximately 0.75 miles north of the site. The majority of the Escondido Creek's flow path is also concrete lined through the developed portions of Escondido. Escondido Creek is partially fed by Lake Dixon and Lake Wohlford, which are located approximately 3 and 5 miles to the northeast. Escondido Creek is tributary to San Elijo Lagoon located approximately 15 miles to the southwest.

The inland surface waters of Reidy (Canyon) Creek, Escondido Creek, Lake Dixon, and Lake Wohlford have been mapped by the CRWQCB to be located in the Escondido Watershed (CRWQCB, 1994). These surface waters have been determined to have existing beneficial uses including municipal and domestic supply, agricultural supply, hydropower generation (except Lake Dixon), contact and non-contact water recreation, warm and cold freshwater habitat, and wildlife habitat. These surface waters have also been determined to have potential beneficial industrial service supply uses.

According to a Preliminary Water Quality Technical Report prepared for the City of Escondido, Reidy Creek, Escondido Creek, San Elijo Lagoon, and the Pacific Ocean at the San Elijo Lagoon outlet are beneficial use impaired water bodies (Fuscoe, 2010). Reidy Creek is impaired from phosphorous. Escondido Creek is impaired from dichlorodiphenyltrichloroethane (DDT), manganese, phosphate, selenium, sulfates, and total dissolved solids.

5.0 POTENTIAL SENSITIVE RECEPTOR SEARCH

Prior consultants have performed research with respects to potential sensitive receptors and groundwater use in the site vicinity. Sensitive receptor research was performed within a 2,500-foot radius of the adjacent Eastern yard of the Public Works facility located at 475 North Spruce Street. The research included searches for domestic or production water supply wells, surface water bodies, schools and day care centers (Secor, 2004). The research reportedly utilized 1) review of the County of San Diego, DEH water well database, 2) review of the State Water Resources Control Board (SWRCB) GeoTracker database, 3) review of USGS Escondido and Valley Center, California 7.5-minute quadrangle topographic maps; and 4) site reconnaissance of properties located within a 2,500-foot radius.

According to reported survey results, no private or public supply wells were identified within the imposed 2,500-foot radius. Further, no schools or day care centers were identified within the imposed 2,500-foot radius.

A survey of the storm channels and the current state of the concrete competency was not performed as a part of this investigation. Initial review of elevational survey data collected from the two channels indicates that the mean sea level (msl) elevation of the invert depth of the base of the storm channels is below that of the observed historical groundwater levels at the adjacent Eastern Public Works yard. This appears to suggest that groundwater emanating from beneath the site could possibly enter the storm channels through breaches and/or penetrations in the concrete.

BBC performed a limited potential sensitive receptor search by reviewing available data records for schools, daycares, and eldercare facilities queried on public internet search engines. BBC identified one private school and one daycare located within a 0.5-mile (2,640-foot) radius of the site:

1.) Christian L.I.F.E. Academy – Private School serving grades 1-12
613 West Valley Parkway, Escondido, CA 92029
(Located approximately 0.4-miles southeast of the subject site)
2.) Ursela's Daycare Center
103 Howell Heights Drive, Escondido, CA 92029
(Located approximately 0.5-miles south of the subject site)

The Christian L.I.F.E. Academy located to the southeast appears to lay down-to-cross-gradient from the site. Both storm channels lie between the site and the school and may create a hydrogeologic barrier. Additionally, dissolved-phase impacts of petroleum hydrocarbons onsite only appear at low-levels in the northwesterly section of the site. Due to the school's distance from the site, the down-to-cross-gradient location, the storm channel locations, and the low concentrations of onsite dissolved-phase impacts at the site, it is unlikely that the school would be adversely affected by known site groundwater impacts.

Ursela's Daycare Center is located to the south of the site, but is located on a topographic rise of more than 100 feet above the subject site elevation (ref:Appendix B). Due to the Daycare's distance from the site and location upon a topographic rise it is unlikely that the Daycare would be adversely affected by known site groundwater impacts.

BBC has prior knowledge of two potential supply wells located within a 0.5-mile radius of the site (BBC, 2007). While assessing environmental impacts in the vicinity of the Auto Parkway, BBC reviewed the Escondido Topographic Quadrangle Map (photo revised 1975 and 1996) that identified a potential supply well for irrigation. The well's location is mapped in the vicinity of Lambar Street at the intersection with Valley Parkway approximately 2,650 feet southwest of the site. At the time of the prior investigation there was no reference as to the then current operation of the well or if the well was known to be in operation or destroyed. No ownership data was provided.

The second potential supply well is reportedly owned and operated by Southland Paving, Inc. located at 361 North Hale Street (CE, 2000) approximately 2,400 feet west-southwest of the site. The well is operated to supply trucks with construction water. BBC contacted Southland Paving in 2007 to inquire of the well's current status. In conversation with a Southland representative it was stated that the well still existed but had not been operated for

approximately 5 years (personal communication, Mr. Bob Kennedy). The well was capped at that time and there was no anticipated use of this well in the future.

To obtain current information regarding potential supply wells within a 0.5-mile radius of the site, BBC requested documents from the Department of Water Resources (DWR) and reviewed available SWRCB data from GeoTracker's Groundwater Ambient Monitoring and Assessment (GAMA) records (http://www.waterboards.ca.gov/gama/). GeoTracker GAMA records indicate that no supply wells are listed within a 0.5-mile radius of the site. Further, records received from DWR indicate that no supply wells are listed within a 0.5-mile radius of the site.

Mapping of potential sensitive receptors and corresponding research is presented in Appendix B.

6.0 FIELD DATA COLLECTION SCOPE OF WORK

In order to initially assess the presence of potential contaminant impacts to soil and to groundwater at the subject site, BBC oversaw the installation of twelve (12) sample point locations (SB-1 through SB-12)(Figure 2) utilizing direct-push equipment in November, 2010. The operation of the direct-push equipment was performed by H&P Mobile Geochemistry (H&P) of Carlsbad, California. Field locations were selected at the property boundaries, at select equipment and materials storage areas, and in the vicinity of the former drainage ditch and current storm drain culverts. The locations of the investigation points also considered data collected from the field utility survey. No permanent monitoring points were installed in the course of this event.

Following the initial assessment performed by BBC, a second assessment event was conducted in April 2012. The work scope was performed in an effort to delineate observed low-level MTBE impacts to groundwater discovered during the initial BBC assessment activities. BBC oversaw the installation of four additional sample point locations (SB-13 through SB-16) (Figure 2). The operation of the direct-push equipment was again performed by H&P. And similarly, no permanent monitoring points were installed in the course of the event.

A brief discussion of the pre-field permitting activities performed prior to the initiation of direct-push soil and groundwater investigations during both the November, 2010 event and the April 2012 event are found in the next section. Following the permitting information is the scope of the direct-push sampling work and sample analyses completed at the site. All work was performed in accordance with approved boring installation permits issued by SAM on November 17, 2010 and again on April 16, 2012.

6.1 PERMITTING, UNDERGROUND SERVICE ALERT, AND UTILITY SURVEY

Permits for the installation of twelve (12) direct-push soil investigation points and the collection of twelve (12) groundwater samples were obtained from SAM prior to performing the initial investigation activities in November 2010. SAM Permit number LMON107483 was assigned to the permitting approval dated November 17, 2010.

Permits for the installation of four (4) direct-push soil investigation points and the collection of four (4) groundwater samples were obtained from SAM prior to performing the second round of investigation activities in April 2012. SAM Permit number LMON108436 was assigned to the permitting approval dated April 16, 2012.

Copies of both permits are presented in Appendix A.

6.2 GEOTECHNICAL BORING INSTALLATION

As part of the potential site development assessment being performed by the City of Escondido, Geocon Consultants, Inc. of San Diego, California installed three geotechnical exploration borings at the subject site in October 2010. No environmental soil sampling was performed during the installation of these geotechnical borings. However, groundwater sampling was performed through the access created by the hollow-stem auger. One groundwater grab sample was collected on October 29, 2010 from each of three geotechnical borings identified as B4, B5, and B6 (Figure 2). Results from the groundwater sampling are presented in Section 7.2 and in Table 3.

All three groundwater samples were analyzed for TPH in the gasoline range by EPA Method 8015B; and for volatile organic compounds by EPA Method 8260B. All groundwater samples collected during the event were stored in an ice-cooled chest and kept at a temperature of less than 4 degrees Celsius until delivery to a state-certified laboratory. Sample handling and relinquishment was performed under standard chain-of-custody protocols.

Further information with respects to the geotechnical assessment of the site can be found in the Geocon Consultants, Inc. report titled, *"Geotechnical Feasibility Investigation"* dated December 13, 2010 (Geocon, 2010).

6.3 SOIL SAMPLE COLLECTION AND LABORATORY ANALYSES

Soil investigation activities were performed using direct-push equipment. This technology as operated by H&P uses a lightweight hydraulic drive point system mounted to the rear of a pickup truck. The hydraulically powered probe is advanced through soils by pushing or hammering. The probe rod is approximately 2.125 inches in diameter and utilizes a split barrel sampler. The sampler is lined with a 1.5 inch by 24 inch acetate liner for sample collection. The system drives the 2.125 inch casing to within approximately 2 feet of the desired sampling depth. Once the sampler has been advanced to the top of the sampling interval, the stop-pin for the piston point that is located inside the cutting shoe is released and retracted using extension rods. The sampler is then advanced through the sampling interval. As soil enters the sampler, the piston point is displaced upward into the sample tube. The sampler is then retracted from the probe hole and disassembled.

Soil samples were withdrawn from the sampler in a 1 inch by 24 inch acetate liner. The acetate liner was removed and divided into three sections. The section advanced furthest below ground surface was selected for laboratory analysis. This section was capped with Teflon™ squares and plastic caps and then labeled and stored in an ice-cooled chest for subsequent transport to a state-certified laboratory for analysis.

The soil in one remaining section was placed into a sealed plastic bag and subsequently screened for the presence of volatile organic vapors using a photo- ionization detector (PID). The third sleeve of soil was used to assess soil characteristics using the Unified Soil Classification System. One boring location (SB-3) was selected for the collection of soils by continuous core to assist with site soil characterization. The drilling logs for both the November 2010 and the April 2012 assessment events are presented in Appendix C.

During the initial assessment event in November 2010, select soil samples from the direct-push investigation points were analyzed for TPH by DHS Modified EPA Method 8015B for gasoline

range, diesel range, and motor oil range hydrocarbons including a carbon chain analysis ranging from C_6-C_{36}; Volatile Organic Compounds (VOCs) by EPA Method 8260B; CAM Metals including mercury by EPA Method 6010B and 7471A; and Polychlorinated Biphenyls (PCBs) by EPA Method 8082.

During the second assessment event in April 2012, select soil samples from the direct-push investigation points were collected for analysis, but held until results from groundwater sampling analyses could be reviewed. Ultimately, groundwater sampling results were deemed sufficient to delineate the low-level MTBE impacts, and no additional soil samples were submitted for analysis.

Standard Operating Procedures for the H&P Strataprobe™ system and BBC field procedures for soil sampling are included in Appendix C. All soil and groundwater samples collected during the event were stored in an ice-cooled chest and kept at a temperature of approximately 4 degrees Celsius until delivery to a state-certified laboratory. Sample handling and relinquishment were performed under standard chain-of-custody protocols.

6.4 GROUNDWATER SAMPLE COLLECTION AND LABORATORY ANALYSES

Groundwater samples were collected to address potential contaminant impacts to first encountered groundwater. One groundwater sample was collected from each of sixteen borings. A total of sixteen (16) groundwater samples were collected. Each of the sixteen samples was collected within the upper 2 feet of the water table in accordance with SAM guidelines.

Prior to the actual sampling of groundwater, groundwater was allowed to recharge into the boring. Recharge times varied from a minimum of 20 minutes to greater than 2 hours. Field measurements for phase separated hydrocarbons (PSH) and depth to water were performed using an interface meter. PSH was not encountered at any of the sampling locations and groundwater samples were then collected by advancing temporary piezometer casing through the open bore hole and directly into the aquifer at the desired sampling depth. The temporary piezometer casing consisted of solid and screened sections of 1 inch polyvinyl chloride (pvc) pipe. The screened section of the pvc pipe was placed so that the screen interval was partially submerged into groundwater. Samples were then obtained using a 0.5 inch diameter bailer. No groundwater field parameters were measured during this event.

Groundwater samples collected were analyzed for TPH by DHS Modified EPA Method 8015B for gasoline range, diesel range, and motor oil range hydrocarbons; and VOCs by EPA Method 8260B. Additionally, groundwater samples collected during the initial November 2010 assessment event were analyzed for CAM Metals including mercury by EPA Method 6010B and 7470A. A carbon chain analysis ranging from C_6-C_{36} was performed. And select groundwater samples were also analyzed for Polychlorinated Biphenyls (PCBs) by EPA Method 8082.

Standard Operating Procedures for the H&P Strataprobe™ system and BBC field procedures for groundwater sampling are included in Appendix C. All soil and groundwater samples collected during the event were stored in an ice-cooled chest and kept at a temperature of approximately 4 degrees Celsius until delivery to a state-certified laboratory. Sample handling and relinquishment was performed under standard chain-of-custody protocols. Analyses performed during the April 2012 event were performed by an onsite mobile laboratory.

6.5 BORING ABANDONMENT

Following completion of groundwater sampling from each investigation point, the temporary piezometer casing was removed from the probe hole. Boring abandonment was completed using a fine granular bentonite slurry. The grout was emplaced from the total depth of each boring to approximately 0.5 feet bgs. Asphalt patching material or a matching ground surface material was placed from approximately 0.5 feet bgs to ground surface to seal the boring.

The abandonment of the twelve direct-push investigation points installed in November 2010 was completed in accordance with SAM Manual guidance and permit conditions. Submittal of the required boring installation report to SAM was performed by BBC on February 16, 2011 (BBC, 2011).

Similarly, abandonment of the four direct-push investigation points installed in April 2012 was completed in accordance with SAM Manual guidance and permit conditions. Submittal of the required boring installation report to SAM was performed by BBC on June 25, 2012 (BBC, 2012).

6.6 WASTE STREAM GENERATION AND DISPOSAL

No waste streams were generated from the two BBC assessment scopes of work. Direct-push sampling is a technology that minimizes waste stream generation such that no soil cuttings were generated during this event. All of the groundwater sample aliquots retrieved during sampling activities were placed into sampling containers. No excess groundwater was generated during this event. Decontamination water utilized in direct-push activities was transported to, and removed from the site by H&P. According to H&P, all decontamination water is contained at their offices in Carlsbad for future manifested disposal.

7.0 FIELD DATA COLLECTION RESULTS

The following sections summarize the results of the soil and groundwater sampling conducted during the November 22nd & 23rd, 2010 field event and the field event conducted on April 25th, 2012. The laboratory analytical results for the November 2010 event, as prepared by Associated Laboratories or Orange, California are presented in Appendix D. The laboratory analytical results for the April 2012 event, as prepared by H&P Mobile Geochemistry of Carlsbad, California are also presented in Appendix D.

7.1 SOIL SAMPLING RESULTS

A total of 32 soil samples were collected during the two site investigation field events. Soil samples were collected at depths ranging from 5 to 16 feet bgs. As discussed earlier in this report (Section 6.3), only the 24 soil samples from the initial November 2010 investigation were submitted for analysis.

Laboratory analytical results from the initial direct-push scope of work indicated that none of the soil samples collected contained TPH in the gasoline range (C_6-C_{10}) above laboratory reporting limits. Only one soil sample (SB-10-5) was reported to contain TPH in the diesel range (C_{10}-C_{22}) at a concentration of 8 mg/kg. Longer chain hydrocarbons (C_{22}-C_{36}) were reported in five shallow soil samples (SB-2-5, SB-3-4, SB-6-5, SB-10-5, and SB-11-5) ranging in concentration from 7.1 mg/kg to 1,210 mg/kg. Only one of these (SB-2-5) exceeded 100 mg/kg TPH.

No volatile organic compounds were detected above laboratory reporting limits in any of the soil samples analyzed.

Investigation points SB-7 and SB-8 were installed in the vicinity of the storage area observed to include electrical materials and components. Soil samples SB-7-5, SB-7-13, SB-8-5, and SB-8-16 were analyzed for PCBs, and no PCB congeners were detected above laboratory reporting limits in any of the soil samples analyzed.

A total of 10 soil samples were selected for total metals analyses. Seven of the samples were shallow samples collected between approximately 4 and 5 feet bgs. The other three soil samples were collected at depths between 13 and 16 feet bgs. Soil sampling results indicated that all ten soil samples contained concentrations of barium, total chromium, cobalt, copper, total lead, nickel, vanadium, and zinc above laboratory reporting limits. Nine of the ten contained arsenic above laboratory reporting limits. And one sample (SB-11-5) also contained concentrations of beryllium above laboratory reporting limits. All reported concentrations are below their respective Total Threshold Limit Concentration (TTLC) as determined by the California Code of Regulations (CCR), Title 22 and therefore would be considered non-hazardous (CCR, Title 22).

Concentrations of metals in soils occur naturally and are greatly dependent upon the geologic and hydrogeologic setting of the area. Further discussions with regards to reported metals concentrations at the site, establishment of background concentrations, and comparisons to human health based and environmental impact soil screening levels are presented in Section 8.0 of this report.

Soil analytical results from this investigation are summarized in Table 1 and Table 2 with complete laboratory reporting and chain-of-custody documentation in Appendix D. CCR, Title 22 TTLC's are presented in Appendix F.

7.2 GROUNDWATER SAMPLING RESULTS

In total, nineteen (19) groundwater samples are reported herein. Three groundwater samples were collected by BBC during geotechnical assessment activities in October 2010; 12 groundwater samples were collected during the November 2010 event; and an additional 4 groundwater samples were collected during the April 2012 event. All groundwater samples were grab samples collected without well purging and/or groundwater parameter monitoring or collection.

After a brief discussion about Maximum Contaminant Levels (MCLs) in groundwater, groundwater sampling results are addressed in four separate sections. The first section will address sampling results for petroleum hydrocarbons and VOCs other than PCE. The second section will address PCE impacts to groundwater identified during these assessment activities. The third section will address metals impacts to groundwater identified during the initial BBC scope of work. And the fourth section will detail the results from PCB analysis of groundwater.

7.2.1 Maximum Contaminant Levels in Groundwater

The State of California Department of Public Health is authorized to protect the public from contaminants in drinking water by the California Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65). The California Department of Public Health has established maximum contaminant levels (MCLs) for public water supplies in CCR, Title 22. MCLs have been

established for contaminants that may occur in public water systems, and may have any adverse health effects (based upon expert opinion). If a known contaminant is present in a water supply at a level that exceeds its established MCL, then action must be taken by the responsible party to protect human health and the environment where it is warranted.

The State of California has established MCLs for MTBE, PCE, and various metals in groundwater. The primary MCL for MTBE in a beneficial use aquifer is 13 ug/L. The MCL for PCE in a beneficial use aquifer is 5 ug/L. MCLs for constituents of concerns in groundwater beneath the subject property are presented at the bottom of Tables 3 and 4. The complete lists of MCLs for Organic Chemicals and for Inorganic Chemicals are presented in Appendix F.

7.2.2 Groundwater Impacts - Petroleum Hydrocarbons

None of the groundwater samples analyzed for TPH in the gasoline range (TPHg), TPH in the diesel range (TPHd), or TPH in the motor oil range (TPHmo) were reported to contain TPH concentrations above laboratory reporting limits.

Low-level concentrations of MTBE were detected in four of the nineteen groundwater samples analyzed. Sample B6 collected from geotechnical boring B6 was reported to contain MTBE at a concentration of 26 ug/L. Samples SB-9 and SB-10 were also reported to contain MTBE at concentrations of 1.9 ug/L and 49 ug/L, respectively. And sample SB-14 was reported to contain MTBE at a concentration of 1.1 ug/L. No other detections of MTBE or any other fuel oxygenates were reported above laboratory reporting limits in any of the groundwater samples collected. MTBE concentrations detected in samples B6 and SB-10 exceed the established MCL for MTBE in groundwater (Table 3).

Additional VOCs (other than PCE) reported during sampling activities included low-level detections of chloroform and p-Isopropyltoluene in sample SB-13. Lab results indicate that chloroform was detected at a concentration of 3.2 ug/L and p-Isopropyltoluene was detected at a concentration of 7.4 ug/L.

The distribution of MTBE in groundwater is shown in Figure 4. The lateral extent of the dissolved-phase plume appears fully assessed revealing a small, low concentration area of MTBE impacts in the northwestern portion of the site. Calculations for the estimated mass of MTBE in the dissolved-phase plume that exceeds the primary MCL of 13 ug/L were performed. And the estimated MTBE mass was calculated to be approximately 0.018 kilograms (kg). This is the equivalent of approximately 0.04 pounds (lbs.) of MTBE. The MTBE mass calculations are presented in Appendix F.

7.2.3 Groundwater Impacts – PCE

The only other VOC reported in groundwater above laboratory reporting limits was tetrachloroethene (PCE). Low-level concentrations of PCE were reported in seven of the nineteen groundwater samples collected and analyzed. PCE concentrations ranged from 2.2 ug/L (SB-13) to 15 ug/L (B6). And PCE concentrations detected in samples B6, SB-10, SB-12, and SB-16 exceed the established MCL for PCE in groundwater (Table 3).

The distribution of PCE in groundwater is presented in Figure 5. The lateral extent of the dissolved-phase PCE concentrations is not fully assessed north of SB-12 or southwest of SB-16. These low-level detections of PCE are consistent with prior groundwater sampling results from several nearby sites. PCE and TCE (trichloroethene) appear in groundwater throughout

the immediate vicinity suggesting a more regional concern for these constituents, rather than a specific relationship to this site. Table A below shows the range of concentrations reported from sites in the area. Document excerpts supporting this table can be found in Appendix E.

TABLE A
PCE AND TCE CONCENTRATIONS AT NEARBY FACILITIES

Address	Distance (ft.) and Direction to Site	# of Sample Points	PCE Range (ug/L)	# of Sample Points	TCE Range (ug/l)
455 North Quince Street	1235' to E	4	27 – 36	4	5.2 – 10
525 North Quince Street	1370' to E	3	3.2 – 25	3	3.4 – 17
480 North Spruce Street	490' to E	3	5.6 - 22	3	5.5 – 9.3
475 North Spruce Street	150' to E	4	5.8 - 13	7	5.3 – 15
755 Norlak Avenue	825' to SE	3	2.83 – 14.9	3	0.81 – 1.26

Notes: E=East, SE=Southeast

Groundwater analytical results for TPH and VOCs from this investigation are summarized in Table 3, with complete laboratory reporting and chain-of-custody documents presented in Appendix D.

7.2.4 Groundwater Analysis Results - Total Metals

All twelve groundwater samples collected from investigation points SB-1 through SB-12 were analyzed for total metals (commonly referred to as CAM 17 Metals). Sixteen of these metals are analyzed by EPA Method 6010B. Mercury in groundwater is analyzed by EPA Method 7470A.

All twelve groundwater samples contained detectable concentrations above laboratory reporting limits for barium, total chromium, cobalt, copper, vanadium, and zinc. Nine of the twelve samples also reported detectable concentrations for total lead and nickel. Arsenic was reported in seven wells; beryllium and molybdenum in five wells; thallium and mercury in four wells; and selenium in two wells.

Metals concentrations identified in groundwater also appear to correspond, in general, with metals concentrations identified in subsurface soils. MCLs for inorganic chemicals in a domestic or municipal use aquifer are exceeded for each metal that has an established MCL with the exception of mercury (Table 4). Concentrations reported in groundwater beneath the site are consistent with concentrations observed in groundwater samples collected by similar protocols at nearby facilities (BBC 2011b, c). Groundwater sampling using direct-push technologies (DPT) is known to negatively bias (bias high) sampling analytical results, especially for metals in a highly turbid groundwater environmental (EPA 2005). The temporary piezometers lack site specific sized screens and/or filter packs to keep formational fines from entering the temporary well point. The groundwater samples collected during this event were known to be turbid as visible sediments were observed in the sampling containers. This was a result of slow recharging wells with minimal water columns for sampling. As such, the potential for artificially high total metals results in groundwater exists in this data set.

Groundwater analytical results for metals from this investigation are summarized in Table 4, with complete laboratory reporting and chain-of-custody documents presented in Appendix D.

7.2.5 Groundwater Analysis Results - PCBs

Investigation points SB-7 and SB-8 were installed in the vicinity of the storage area observed to include electrical materials and components. Groundwater samples SB-7 and SB-8 were analyzed for PCBs, and no PCB congeners were detected above laboratory reporting limits in either of the groundwater samples analyzed.

8.0 ENVIRONMENTAL SCREENING LEVELS

One standard for evaluation of contaminant impacts in soil is to compare site specific data to established environmental screening levels and naturally occurring background levels for the constituents of concern (COCs). In this section, BBC will perform comparative analysis of reported metals concentrations in soils against the California EPA Environmental Screening Levels (ESLs) and the US EPA Region 9 Regional Screening Levels (RSLs). This method of assessment is performed an effort to set the reported concentrations of COCs in context with human health and environmental risk-based levels for commercial and industrial property uses. A brief discussion of ESLs and RSLs is presented in advance of the comparative analyses.

8.1 CALIFORNIA EPA ENVIRONMENTAL SCREENING LEVELS

The California EPA has developed ESLs through the work of the California Regional Water Quality Control Board, San Francisco Bay Region (CRWQCB (2)). The CRWQCB (2) developed ESLs for various constituents as a way to quickly identify if constituent impact concentrations would likely require further investigation and/or action to ensure public health and safety. The use of ESLs is intended to be entirely optional on the part of the regulatory oversight agency. The presence of a chemical or constituent at concentrations that exceed an ESL does not necessarily indicate that adverse impacts to human health or the environment are occurring; only that additional evaluation is likely warranted.

ESLs consider multiple routes to a potential receptor including direct exposure to human health, vapor intrusion into buildings, soil leaching to groundwater, and nuisances such as odors. ESLs are presented in various settings such as shallow soil impacts or deep soil impacts; residential land use or commercial/industrial land use; and soil impacts above groundwater with potential drinking water uses and without. This allows the analyst the opportunity to select an evaluation criterion that most closely represents site conditions.

8.2 U.S. EPA REGION 9 REGIONAL SCREENING LEVELS

EPA Region 9 has developed RSLs as a replacement to the former industry standard of Preliminary Remediation Goals (or PRGs). The former PRGs from EPA Region 9 were compiled and harmonized with similar risk-based approaches from EPA Region 3 and Region 6.

RSLs have been developed using risk assessment guidance from the Superfund program. The RSLs are generic. They can be re-calculated using site specific data. They are risk-based concentrations that are considered by the EPA to be protective of human health over a lifetime. RSLs differ from ESLs in that they do not consider non-human endpoints such as ecological impacts. The roles of the screening levels are similar in that the presence of a chemical or constituent at concentrations that exceed an RSL does not necessarily indicate that adverse impacts to human health are occurring; only that additional federal evaluation is likely appropriate.

8.3 COMPARISON OF METALS IN SOILS TO ESLs AND RSLs

Seven shallow soil samples were collected from a depth of approximately 5 feet bgs during this field event. The laboratory analytical results indicated that 10 different metals were present in soils above the laboratory reporting limit. The laboratory analytical results are presented in Table 5 and compared to California EPA ESLs and US EPA RSLs. The comparison is made in an effort to establish if additional environmental assessment of metal concentrations in site soils appears warranted.

Nine of the ten metals reported above laboratory reporting limits were not reported at concentrations exceeding California EPA ESLs for commercial and/or industrial land use or US EPA RSLs for industrial land use. Arsenic was the only constituent that was reported present at concentrations above ESLs or RSLs for commercial and/or industrial land use. Arsenic concentrations ranged from 1.10 to 2.08 mg/kg (Table 5).

Arsenic is regularly observed as a naturally occurring metal in California soils. The reported concentrations of arsenic in site soils only slightly exceeded the environmental screening level of 1.6 mg/kg. Further, in comparison to published background levels of arsenic in the southern California region, the reported concentrations in all five samples are below the 12 mg/kg upper bound for naturally occurring arsenic identified in a California Department of Toxic Substances Control (DTSC) study (DTSC, 2008). This suggests that these low level arsenic impacts reported in soils are likely naturally occurring and do not appear to warrant further investigation at this time.

9.0 FINDINGS

Soils encountered during all BBC boring installation activities appeared consistent with historical geologic logging performed at the site. Site soils consist of silty and clayey fine to medium sands overlying decomposed granitic rock. The decomposed granitic rock was encountered in only three locations at depths shallower than 20 feet bgs during these investigations. Two locations (SB-5 and SB-6) were located in the southeastern corner of the property. The third (SB-13) was located in the northwest portion of the site. Geotechnical borings installed in October 2010 indicated the occurrence of weathered granitic rock at depths between 19 and 25 feet bgs (Geocon, 2010).

Depth to first groundwater during this investigation ranged from approximately 13 feet bgs to 22 feet bgs at the site. After recharge, groundwater levels were observed between 13 and 19 feet bgs. Since no permanent groundwater wells were installed, a calculated groundwater gradient is not available at this time. However, the site proximity to both the Reidy Creek storm drain channel and the Escondido Creek storm drain channel suggests that groundwater flow in the area may range in direction from southeast to southwest. As the site is bounded by Reidy Creek to the southeast and the confluence of the two storm drain channels lies to the south we have estimated the groundwater flow direction to be towards the confluence for the purposes of this report (Figure 4 and Figure 5).

Historical records and aerial photographs were key in disclosing the location of a former ditch that meandered across the subject site from northeast to southwest (Figure 2). The drainage ditch was a known source of TRPH contamination ($>C_{23}$) which emanated from the Palomar Ready Mix facility (NEI 1991b). The remedial excavation performed along the ditch extended approximately 415 feet from the common property line Palomar Ready Mix. The excavation was unevenly dug to a depth not exceeding 4.5 feet below ground surface. The noted length of

the excavation would place the westerly end in the vicinity of boring SB-3, with the remainder of the drainage ditch continuing to the west-southwest (Figure 3).

The location of the ditch and the excavation activities are proximate to borings SB-2 and SB-3 that were installed in November 2010. And shallow soil sampling results indicate that TPHmo (C_{22} – C_{36}) was present in samples SB-2-5 and SB-3-5 at concentrations of 1,210 mg/kg and 55 mg/kg. The larger chain hydrocarbons are of the same range that were detected and remediated along the former drainage ditch in 1991 as part of closed DEH case number H20272-003. Soil samples SB-2-15 and SB-3-16 were collected at depths beneath the two shallow samples and were also analyzed for TPHmo. Both SB-2-15 and SB-3-16 were reported not to contain TPHmo above laboratory reporting limits. This vertical delineation of the soil impacts suggests that TPHmo is present in shallow soils but does not extend to groundwater. The absence of TPH in groundwater beneath the site further supports this line of evidence.

Soil sampling results indicate that TPHg was not present above laboratory reporting limits in onsite soils investigated during the November 2010 field event. Similarly, only one minor impact for TPHd was reported in shallow soil sample SB-10-5 at a concentration of 8 mg/kg.

None of the soil samples analyzed contained concentrations of VOCs above laboratory reporting limits.

Soil samples SB-7-5, SB-7-13, SB-8-5, and SB-8-16 were also analyzed for PCBs. None of the soil samples analyzed contained concentrations of PCBs above laboratory reporting limits.
Laboratory analytical results reported 10 different metals were present in soil samples collected during the November 2010 field event (Table 2). The reported metals concentrations were compared to environmental screening levels established by the California EPA (ESLs) and U.S. EPA Region 9 (RSLs) to evaluate if these concentrations may warrant further assessment. Nine of the ten identified metals were reported at levels that fell below the screening levels of both ESLs and RSLs for commercial and/or industrial land use. Only arsenic exceeded the regulatory screening levels. Further evaluation of the reported arsenic concentrations was performed against published DTSC ranges for naturally occurring arsenic in southern California. The evaluation identified that the reported levels of arsenic in site soils fall within the estimated range for naturally occurring arsenic in this region.

The primary maximum allowable contamination level (MCL) for MTBE in a potential beneficial use aquifer in California is 13 ug/L (CCR, Title 22). Groundwater concentrations identified in samples B6 and SB-10 exceed this MCL. Delineation of the lateral extent of these low-level MTBE impacts was achieved with the April 2012 site investigation activities. The sampling results reveal a small, low concentration area of MTBE impacts in the northwestern portion of the site (Figure 3). The total MTBE mass that exceeds the primary MCL of 13 ug/L in this small dissolved-phase plume is estimated to be approximately 0.04 lbs.

Low-level impacts of PCE were reported in the groundwater samples collected during the boring installation events. PCE impacts ranged between 2.2 and 15 ug/L, just above the laboratory reporting limit (and MCL) of 5.0 ug/L. Additional research and assessment of PCE impacts at other sites in the near vicinity was performed. The research revealed that PCE is present at similar concentrations in groundwater at multiple facilities in this area suggesting more of a regional problem rather than an association with this site's current or former operations.

Groundwater samples SB-7 and SB-8 were analyzed for PCBs, and no PCB congeners were reported above laboratory reporting limits.

Groundwater impacts of seven CAM Metals exceed MCLs at the site. Concentrations reported in groundwater beneath the site are consistent with concentrations observed in groundwater samples collected by similar protocols at nearby facilities (BBC 2011, a, c). Groundwater sampling using direct-push technologies (DPT) is known to negatively bias (bias high) sampling analytical results, especially for metals in a highly turbid groundwater environment (EPA 2005). The groundwater samples collected during this event were known to be turbid as visible sediments were observed in the sampling containers. As such, the potential for artificially high total metals results in groundwater exists in this data set.

10.0 CONCLUSIONS AND RECOMMENDATIONS

The soil and groundwater investigative activities have helped by identifying both past and present environmental considerations at the subject site. Prior documented TRPH (>C_{23}) impacts to soil were identified to exist along a drainage ditch that ran from northeast to southwest across the subject property. The origin of the contamination was noted to be the adjacent Palomar Ready Mix facility located east of the site. The County of San Diego, DEH case (H20272-003) associated with these findings was closed in August 1991.

Historical aerial photographs clearly show the drainage ditch identified in earlier environmental assessment reports (Appendix E). And comparing the most recent aerial photos to those from 1939 and 1942 suggest the ditch may have been the original path of Reidy Creek prior to the construction of the concrete storm channels in the area.

In April 1991, a remedial excavation was performed. The excavation progressed along the drainage ditch on the site. The excavation is noted to have been approximately 415 feet long, and unevenly dug to a depth not exceeding 4.5 feet below ground surface (bgs). An excavation of that length would have extended to the proximity of soil borings SB-2 and SB-3 installed in November 2010 (Figure 3). And the detection of heavy hydrocarbons reported in soil sample SB-2-5 (1,210 mg/kg) may possibly be residual contamination from the drainage ditch that was not removed during shallow soil excavation activities. Soil sample SB-2-15, collected directly beneath the identified impact at a depth of approximately 15 feet bgs did not contain TPHmo above laboratory reporting limits. This vertical delineation of the shallow soil impact suggests it is limited in nature, and the absence of total petroleum hydrocarbons in groundwater beneath the site supports this line of evidence.

Soil impacts of total petroleum hydrocarbons in the gasoline range were not detected above laboratory reporting limits (3.0 mg/kg) in any of the twelve borings installed as part of the November 2010 assessment. Similarly, only one minor detection of TPH in the diesel range (8.0 mg/kg) was reported in onsite soils. The site is absent of detections for VOC's in soils. And no detections of PCBs in soils were reported.

In groundwater, only four low-level impacts of MTBE were reported from the nineteen groundwater samples analyzed. MTBE detections ranged from 1.1 to 49 ug/L. The only other VOC detected above reporting limits was PCE. All other VOC's in groundwater were below laboratory reporting limits. Delineation of the lateral extent of these low-level MTBE impacts was achieved with the April 2012 site investigation activities. The sampling results reveal a small, low concentration area of MTBE impacts in the northwestern portion of the site (Figure 3). The MTBE mass in groundwater beneath the site that exceeds the primary MCL of 13 ug/L is estimated to be 0.04 lbs.

Low-level PCE detections reported beneath the site are similar in concentration to PCE impacts discovered at other DEH case sites in this area. The impacts appear regionally between approximately 5-35 ug/L. The absence of VOC's in onsite soils suggests that these impacts are associated with the regional, offsite impacts to groundwater reported in the area and have no specific relation to this site's operations.

BBC assessment activities have identified that low-level, non-hazardous concentrations of naturally occurring metals in shallow site soils do exist at the site. Comparative evaluations of reported metals concentrations with both State and Federal environmental screening levels indicate that site soils do not appear to present a threat to human health or the environment above recognized risk thresholds.

As a result of these naturally occurring metals in soils, metals concentrations in groundwater are also present. Seven different metals exceeded MCLs, however, sampling results appear biased by the turbid, sediment laden sample aliquots that were collected. Sampling results for metals in groundwater were similar in concentration to those observed at nearby facilities that had been collected under similar protocols. The metals concentrations observed in groundwater beneath the subject site appear to be a result of the naturally occurring metals in site soils.

Finally, this characterization effort was performed in an effort to assess any potential environmental considerations that may exist in advance of redevelopment activities. It is not known when site redevelopment activities may take place at the subject site. The site is anticipated to remain a materials and aggregate storage yard and to continue to be used as a heavy equipment training grounds until the City of Escondido identifies a viable development project.

Based upon these results BBC Environmental, Inc. (BBC) recommends that the small area of soils impacted with TRPH observed in the vicinity of soil boring SB-2 and known historically to exist along the location of the former drainage ditch be documented by this report. No further action is recommended at this time. However, future site activities that may include shallow grading in the area of SB-2 or along the former drainage ditch should be performed in accordance with DEH directives regarding the handling of soils impacted by TRPH.

The low-level MTBE impacts reported beneath the site appear limited to the northwestern portion of site and are fully delineated. No onsite soil source area has been detected, and MTBE oxygenated fuels are no longer distributed in California. Calculations for the estimated mass of MTBE in the dissolved-phase plume that exceeds the primary MCL of 13 ug/L were performed, and the estimated MTBE mass was calculated to be approximately 0.018 kilograms (kg). This is the equivalent of approximately 0.04 pounds (lbs.) of MTBE. As such, no further action with regards to the MTBE impacts in groundwater beneath the site are recommended.

Lastly, no further assessment with respects to TPHg, TPHd, VOC's, and PCBs at the site appears warranted at this time.

11.0 REPORT CLOSURE

The work herein has been conducted based on current scientific principles. These site evaluation results depend directly on that information and the testing documented herein. BBC Environmental, Inc. makes no warranties or guarantees as to the accuracy or completeness of information provided or compiled by others. It is possible that information exists beyond that which was not reviewed and/or produced under the contracted scope of this investigation. Additional information which was not found, provided, or available, as well as changes or corrections to site data may alter interpretations herein, and if such changes are manifest, it is recommended that these evaluations be updated accordingly. Hydrogeologic and in situ chemical evaluations have some level of inherent uncertainty in that molecular scale processes are represented by a macroscopic continuum, and results should be viewed accordingly. Similarly, the discrete distributions and effects of geologic heterogeneity at most sites are unknown. Evaluations have been conducted in accordance with scientific principles and the professional standards of the State of California and other states with reciprocal professional standards. No other warranty, express or implied, is provided.

Notes: [1] samples were analyzed for Total Petroleum Hydrocarbons as Gasoline (C6-C10) by EPA method 8015B. [2] samples were analyzed for Total Extractable Petroleum Hydrocarbons by EPA method 8015B for Diesel (C10-C22) and Motor Oil (C22-C36). [3] samples were analyzed for the full list of Volitile Organic Compounds by EPA method 8260B. VOCs not list in this table were not detected above the laboratory reporting limits. SB-7 and SB-8 were analyzed for PCBs by EPA method 8082. All PCB congeners analyzed reported below the laboratory reporting limits. VOCs Abbreviations: MTBE = Methyl tert-Butyl Ether, DIPE = Di-isopropyl Ether, ETBE = Ethyl tert-Butyl Ether, TAME = tert-Amyl Methyl Ether, TBA = tert-Butyl Alcohol, PCE = Tetrachloroethene, mg/Kg = milligrams per kilogram, feet = approximate feet below ground surface, -- = Not measured, NA = not applicable. Reporting Limits are presented with a dilution factor of 1. Please refer to the lab report for dilution factors for each individual sample analyzed.
β = Sample SB-10-5 was reported to contain 38 mg/kg of TPH in the C6-C10 range when analyzed by TEPH Fingerprint analysis.

Notes: [1] samples were analyzed for Total Petroleum Hydrocarbons as Gasoline (C6-C10) by EPA method 8015B;α denotes (C5-C11). [2] samples were analyzed for Total Extractable Petroleum Hydrocarbons by EPA method 8015B for Diesel (C10-C22); β denotes (C12-C24). [3] samples were analyzed for Total Extractable Petroleum Hydrocarbons by EPA Method 8015B for Motor Oil (C22-C36); ϕ denotes (C25-C36). [4] samples were analyzed for the full list of Volitile Organic Compounds by EPA method 8260B. VOCs not list in this table were not detected above the laboratory reporting limits. SB-7 and SB-8 were analyzed for PCBs by EPA method 8082. All PCB congeners analyzed reported below the laboratory reporting limits. VOCs Abbreviations: MTBE = Methyl tert-Butyl Ether, DIPE = Di-isopropyl Ether, ETBE = Ethyl tert-Butyl Ether, TAME = tert-Amyl Methyl Ether, TBA = tert-Butyl Alcohol, PCE = Tetrachloroethene, µg/L = micrograms per liter, feet = approximate feet below ground surface, -- = Not measured, NA = not applicable. Reporting Limits are presented with a dilution factor of 1. Please refer to the lab report for dilution factors for each individual sample analyzed. MCL=maximum contaminant level as listed under CCR Title 22, Table 64444-A. λ = California Drinking Water Action Level as determined by California Department of Public Health.

Regulatory Correspondence and Permits

PERMIT #LMON107483
A.P.N. #232-090-72-00
EST #NONE

COUNTY OF SAN DIEGO
DEPARTMENT OF ENVIRONMENTAL HEALTH
LAND AND WATER QUALITY DIVISION
MONITORING WELL PROGRAM
SOIL BORING CONSTRUCTION PERMIT

SITE NAME: CITY OF ESCONDIDO PUBLIC WORKS YARD (WESTERN YARD)

SITE ADDRESS: 901 W WASHINGTON AVE, ESCONDIDO, CA 92025

PERMIT FOR: 12 SOIL BORINGS

PERMIT APPROVAL DATE: NOVEMBER 17, 2010

PERMIT EXPIRES ON: MARCH 17, 2011

RESPONSIBLE PARTY: CITY OF ESCONDIDO

PERMIT CONDITIONS:

1. All borings must be sealed from the bottom of the boring to the ground surface with an approved sealing material as specified in California Well Standards Bulletin 74-90, Part III, Section 19.D. **Drill cuttings are not an acceptable fill material.**

2. All borings must be properly destroyed within 24 hours of drilling.

3. Placement of any sealing material at a depth greater than 30 feet must be done using the tremie method.

4. All water and soil resulting from the activities covered by this permit must be managed, stored and disposed of as specified in the SAM Manual in Section 5, II, E- 4. (**http://www.sdcounty.ca.gov/deh/lwq/sam/manual_guidelines.html**). In addition, drill cuttings must be properly handled and disposed in compliance with the Stormwater Best Management Practices of the local jurisdiction.

5. Within 60 days of completing work, submit a well construction report, including all well and/or boring logs and laboratory data to the Well Permit Desk. This report must include all items required by the SAM Manual, Section 5, Pages 6 & 7.

6. This office must be given 48-hour notice of any drilling activity on this site and advanced notification of drilling cancellation. Please contact the Well Permit Desk at 619) 338-2339.

NOTE: **This permit does not constitute approval of a work plan as defined in Section 2722 of Article 11 of C.C.R., Title 23. Work plans are required for all unauthorized release investigations in San Diego County.**

G. FEES (in effect beginning July 1, 2011, through June 30, 2012)

ACTIVITY	FEE SCHEDULE	AMOUNT
Permit for Well Installations Only (Groundwater Monitoring Wells, Vadose, Vapor Extraction Wells)	$200.00 for the first monitoring well ……	**$200.00**
Permit for Well Maintenance Inspection (Valid for three years)	$99.00 for first well maintenance inspection	**$99.00**
Each Additional New Well	$161.00 for each additional well installation	___ **x** **$161.00** **$**_____
	$ 30.00 for each additional well maintenance inspection ……..	___ **x** **$ 30.00** **$**_____

Permit for Borings Only *(CPT's, Hydropunch, Geoprobes, Temporary Well Points, etc.)*	$200.00 for the first boring …… $ 49.00 for each additional boring ……	**1** x **$200.00** **3** x **$ 49.00**	**$200.00** **$147.00**
Permit for Well Destructions Only	$200.00 for the first destruction …… $123.00 for each additional destruction …	___ x **$200.00** ___ x **$123.00**	$_____ $_____
Permit for any Combination of Well Installations, Borings, & Destructions (*except UST backfill permit)*	The first activity will be $200.00 **Additional activities will be as follows:** $161.00 for each additional well $99.00 for first well maintenance inspection $ 30.00 for each additional well maintenance inspection $123.00 for each well destruction $ 49.00 for each additional boring	___ x **$200.00** ___ x **$161.00** ___ x **$ 99.00** ___ x **$ 30.00** ___ x **$123.00** ___ x **$ 49.00**	$_____ $_____ $_____ $_____ $_____ $_____
Permit for Underground Storage Tank Monitoring System in Backfill *(i.e. Enhanced Leak Detection)*	**$320.00** **(Flat Fee)**		$_____
	TOTAL COST OF PERMIT		**$347.00**

H. QUESTIONNAIRE: Please answer all applicable questions completely. For well destructions, complete only #1 below and submit any required supportive documentation.

1. If wells are to be destroyed, provide a description of method of destruction N/A

2. What is the purpose of the well/boring investigation?

   ☐ a. Part of an ongoing site assessment case in which a government regulator is the lead agency. If yes, indicate which government regulator is the lead agency and the case number.

   _____ DEH _____ RWQCB _____ DTSC

   ☒ b. Part of a Phase I investigation for property ownership transfer or: Land Owner Due Diligence

   ☐ c. Geotechnical investigation for proposed construction, land stabilization or:

   ☐ d. Other: _____

3. What procedures will be used to prevent the well/boring from providing an avenue to contamination during construction? Borings shall be backfilled using a bentonite grout seal with a concrete (or material to match existing) seal above. Borings shall be backfilled immediately after sample collection is completed.

4. What field procedures will be utilized to determine if contamination exists? Soil sampling will be conducted at ~5 feet bgs and at the depth of first encountered groundwater. Each of the borings will have a groundwater sample collected using a bailer deployed through a temporary piezometer installed within the bore hole.

5. What procedures will be used to determine whether samples will be sent for laboratory testing or archiving? Field monitoring for volatile organic vapors will be conducted using a PID on each of the collected soil samples. A field determination will be made following each boring installation as to how many of the collected samples will be run.

6. What constituents will be monitored and tested (Include EPA Laboratory Test Methods to be used)? Groundwater samples will be analyzed for TPH by EPA Method 8015M and MTBE by EPA Method 8260B; Select soil samples will also be analyzed for TPH by EPA Method 8015M and VOCs by 8260B.

7. How will samples be transported and preserved? Samples will be transported under Chain-of-Custody protocols to the laboratory. Samples will be kept chilled to ~4-degrees celcius until received by the laboratory.

8. What sampling methods will be used? Soil samples will be collected using direct-push soil sampling methodologies and groundwater samples will be collected using a bailer deployed through a temporary piezometer installed in each of the bore holes.

9. Are you proposing a variation from the methods and/or procedures presented in the requirements for the construction or destruction of Vadose and Groundwater Monitoring Wells (Current SAM Manual Requirements)? If yes, specify these variations and include a well construction diagram and all required supporting documentation. Refer to the SAM Manual Appendix B for monitoring well guidelines (www.sdcdeh.org). Yes ☐ No ☒ _____

10. Are you proposing a variation in drilling and destruction of soil borings from the methods and/or procedures specified in the current SAM manual? If yes, specify these variations and include a destruction diagram. Yes ☐ No ☒ _____

11. What procedures will be used to ensure that the drilling equipment will introduce no contamination? Decontamination procedures in accordance with the current SAM Manual guidelines will be conducted on all utilized field sampling equipment prior to the initial direct-push, and following retrieval of the direct-push equipment.

12. What methods will be used to clean sampling equipment? Sampling equipment will be first brushed and/or pressure washed with a detergent and water mix (Liquinox/Alconox or like), followed by two subsequent clean water rinses.

13. What cleaning method will be used to clean casing and screen prior to installation? Sampling sleeves, casing, screen, and sampling materials utilized in the direct-push method and during installation of the temporary piezometer shall be virgin material packed from the manufacturer and will not require cleaning prior to installation.

14. A Property Owner Consent (POC) agreement is required for all applications, except for onsite, open LOP/SAM site assessment cases, Caltrans properties and military properties.

Proposed locations for subsurface work:

Property Address:

901 W. Washington Avenue

Escondido, CA 92025

Assessor's Parcel Number (APN):

232-090-72-00

I, City of Escondido, owner of the property/properties listed above, give my permission to BBC Environmental, Inc. (consulting company, contractor) to conduct the following work at the locations stated above.

☐ Install _____ monitoring wells ☐ Destroy _____ monitoring wells ☒ Drill 4 soil borings

I understand that Mr. Gerry Shiller (registered professional) of BBC Envirionmental, Inc. (consulting company) and an authorized signer for H&P Mobile GeoChemistry (drilling company) have submitted a signed application to the Department of Environmental Health in which they have agreed to complete the above-stated work according the requirements of the current SAM Manual, all ordinances and laws of the County of San Diego and the State of California pertaining to well/boring construction and destruction. I have arranged with the Responsible Party, the person who causes to have monitoring wells/borings installed or existing wells destroyed on this property, to ensure proper closure of the monitoring wells/borings.

F. Allee
HMMD - SA/M

George Johnson
North County Transit Development Board
311 S. Tremont Street
Oceanside, CA 92054

Dear Mr. Johnson:

RE: ESCONDIDO CORPORATE YARD EXPANSION PROJECT
475 N. SPRUCE STREET, ESCONDIDO, CA
HMMD H75 CASE H20272-003, APN 232-090-02, 03, 40, 44, 64, 65

The site remediation information submitted to this agency by Nachant Environmental Incorporated, summarizing the site characterization and mitigation activities at the above referenced location has been reviewed. With the provision that the information provided to this agency was accurate and representative of existing conditions, it is the position of this office that no further action is required at this time.

This information has also been discussed with staff of the Regional Water Quality Control Board (RWQCB). Based on the information submitted and current requirements, the RWQCB concurs with the determination of this agency that no further action is required at this time.

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present, or future operations at the site. Nor does it relieve you of the responsibility to clean up existing, additional or previously unidentified conditions at the site which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health.

Additionally, be advised that changes in the present or proposed use of the site may require further site characterization and mitigation activity. It is the property owner's responsibility to notify this agency of any changes in report content, future contamination findings, or site usage.

Thank you for your efforts in resolving this matter. Please contact Fred Allee of the Hazardous Materials Management Division at (619) 338-2470, if you require additional assistance.

Sincerely,

GARY R. STEPHANY, Deputy Director
Environmental Health Services

PHONE: (619)967-2890 or 2898

ADDRESS: North County Transit Development Board

311 S. Tremont Street, Oceanside, CA 92054

MAILING ADDRESS: SAME

PROPERTY OWNER: Initial: NCTD Final: City of Escondido (following closure)

SITE INFORMATION

CONTAMINATION EXTENDS FROM SOURCE OFF PROPERTY: No

BENEFICIAL GROUND WATER USE AREA: Yes

Depth to ground water: Approx. 13 feet

Gradient: From Northeast to Southwest, very slight

REMAINING PUBLIC HEALTH RISKS: No

FURTHER ENVIRONMENTAL MONITORING REQUIRED: No

CONSULTANT'S REPORTS ON FILE: Yes

Consultant Name: Nachant Environmental Incorporated

RWQCB CONCURRENCE WITH CLOSURE: Yes

RWQCB Staff Name: Jim Munch Date Discussed: 8/19/91

ANALYTICAL TESTS PERFORMED

Diesel Suspected		Waste Oil Suspected	
DHS TPH (23.9 ppm)		EPA 418.1	(ND)
EPA 8020	(BTXE, ND)	EPA 8020	(BTXE, ND)
DHS O-Pb	(ND)	EPA 6010	(Title 22 Metals, ND)
		EPA 8010	(Solvents, ND)
		EPA 8080	(PCB's, ND)

CLEANUP LEVELS ESTABLISHED: 100 mg/kg TPH

MAXIMUM CONCENTRATION DISCOVERED ON-SITE: 4,980 mg/kg TPH

MAXIMUM CONCENTRATION REMAINING ON-SITE: 23.9 mg/kg TPH

REMEDIATION OF SOIL: Yes

Remedial Method: Excavate

OFF SITE DISPOSAL OF SOIL: Yes

MANIFESTS PROVIDED: Yes (NON HAZARDOUS)

Facility Location: Sycamore Landfill

Quantity Removed: Approx. 22 yd^3

Sampling Protocol: HMMD SA/M Manual, 1/91

Statistics Provided: Yes, Mean = 229 mg/kg TPH (diesel)

STOCKPILED SOILS REMAINING ON SITE: No

OPEN EXCAVATION(s) REMAINING ON SITE: Area excavated during remedial activities is an un-lined drainage ditch which remains open to supply site drainage. Diesel impacted soils removed from the ditch were disposed of to Sycamore. No other areas on the site were excavated.

COMMENTS

This case came to HMMD attention through the H75 process and did not involve an UST system. The source of the hydrocarbons discovered within the ditch soils at the site was initially unknown, therefore the consultant assumed the worst case (waste oil) and analyzed early soil samples accordingly. Eventually it was determined that the hydrocarbons originated from truck washing activities conducted at the facility to the east of the site (Palomar Transit Mix Inc.) and that the hydrocarbons were predominantly diesel. Screening conducted for all other chemical compounds (refer to analytical section above) showed levels below the detection limits of the various analysis methods used.

1.0 Vehicle

1.1 Discussion

The *STRATAPROBE*™ is a rugged, lightweight hydraulic drive point system designed to perform sampling and monitoring services specific to the environmental industry. The carrier vehicle is a four wheel drive, one ton pickup truck with a reliable power take-off hydraulic system. One of the most versatile systems of its kind the *STRATAPROBE* can drive an assortment of sampling devices fifty to sixty feet in many soil formations.

The direct push hydraulic unit consists of a rear-mounted, dual ram configuration mounted in conjunction with a vibrating component that is capable of producing high-frequency impact energy. A 5,000 pound static reaction weight and 15,000 pound pullback capacity provide ample force to overcome most common geologic conditions. The low profile mast is twelve feet high when fully extended and the framework of the machine is boom articulated to allow for a full range of positioning.

The *STRATAPROBE*'s low profile and articulated boom provide for easy access when sampling under canopies, adjacent to structures and inside buildings. A Geoprobe 540MT limited access rig and/or hand held portable equipment are also available where truck access is not possible.

1.2 Operation

The STRATAPROBE is operated from a station at the rear of a 1-ton pickup truck. The probing unit is hydraulically powered via a power takeoff pump mounted directly to the truck's transmission. Positioning, pushing, and retracting of the probe and hammer is controlled by two separate hydraulic control manifolds located at the operating station. Each manifold consists of four to six spring-return to neutral control valves. The spring return feature provides a safety function, which stops all probing and positioning action if the operator releases the valve.

1.3 Emergency Operation

In the event of any emergency such as fire or hydraulic system failure all power to the probing unit and vehicle can be secured by turning off the vehicle ignition key along with an emergency shut off switch which is located at the rear of the truck within reach of the operator. A fire extinguisher is carried in the truck cab for emergency use. Under no circumstances should the truck or probe be operated in other than its normal configuration.

2.0 Soil Sampling Procedures

2.1 Discussion

Soil samples may be obtained by using either two primary soil samplers depending on the amount of sample needed. A 1.5-inch OD x 24-inch split-spoon sampler can be used to collect soil samples in a 1.0-inch x 24-inch acetate liner. A 2.125-inch OD x 48-inch macro-core sampler can be used to collect soil samples in a 1.5-inch x 48-inch acetate liner. Macro-core samplers are also available in 24-inch lengths.

The samplers are threaded onto the leading edge of *STRATAPROBE* 1.5-inch O.D. probe rod and advanced to depth using the *STRATAPROBE* direct push system. The probe rods are nominally 4-feet in length and additional rods are connected to reach the desired depth. There are two primary sampling methods which can be achieved with either the spit-spoon sampler or the macro-core sampler.

Discrete/Closed Piston Soil Sampling

A piston point is held inside the cutting shoe by a piston rod. The piston rod extends up through the sampler into the drive head. A stop-pin threaded into the drive head holds the piston rod in place thus holding the piston point in place. Once the sampler has been advanced to the top of the sampling interval, the stop-pin is released via extension rods and retracted. The sampler is then advanced through the sampling interval. As soil enters the sampler, the piston point and piston rod are displaced upward into the sample tube. The sampler is then retracted from the probe hole and disassembled. The sleeve is removed from the sampler at which point the sample can be cut to desired length, capped with Teflon squares and end caps and sent to the laboratory for analysis.

Continuous Core Sampling

It is recommend that the 48-inch macro-core sampler be used for continuous core sampling because of the extended sample lengths, but a 24-inch split-spoon or 24-inch macro-core sampler may also be used. Continuous coring starts at the ground surface with an open-ended sampler. The sampler is driven through the soil for the length of the sampler, and then retracted and the sample removed. In stable soils, the open-tube sampler is inserted back down the same hole to obtain the next core from the next sample interval. In unstable soils, the sampler can be equipped with the closed piston sampling equipment to assure the sample is collected from the correct sample interval along the continuous core.

Sampling rates vary from 100' to 200' per day depending on soil conditions. Use of the coring tube provides for observation of subsurface conditions. The coring tube can also be used to create an open bore hole for inserting water or vapor monitoring well points.

3.0 Groundwater Sampling Procedures

STRATAPROBE provides high quality groundwater sampling using one of the following techniques:

3.1 HYDROPUNCH II™ - TYPE GROUNDWATER SAMPLING

Groundwater samples are obtained using a Hydropunch II™ - type of sampler. The sampler is a 48" x 1.75" diameter stainless steel tube containing a retracted and shielded stainless steel well screen with a drop-off expendable point. The sampler is threaded onto a 1.5" O.D. heavy duty probe rod and advanced directly into the aquifer in the shielded position with the STRATAPROBE direct push system.

When the desired depth is reached, the probe rod is retracted approximately 48". The expendable point drops off and the stainless steel sample screen is exposed. Groundwater flows past the screen and into the void space of the sampler. Samples are then obtained using either a 1/2" O.D. (minimum) bailer or using a peristaltic pump and inert tubing.

3.2 SAMPLING POINT GROUNDWATER SAMPLING

Groundwater samples are obtained using a sample point consisting of a 36" x 1/2" diameter slotted teflon well screen connected to the surface via 3/8" diameter inert nylaflow tubing. The sampler is inserted by first driving a 1.5" O.D. heavy duty probe rod, point holder and expendable point with an o-ring seal directly into the aquifer. When the desired depth is reached, a short section of the slotted well screen attached to an inert nylaflow or clear plastic tubing is lowered to the bottom of the drive rod. The drive rod and point holder are then withdrawn, the expendable point drops off and the well screen is exposed to the aquifer.

Groundwater flows past the screen and into the void space of the sampler. Groundwater samples are then obtained using either a bailer or peristaltic pump connected to polyethylene tubing.

3.3 MINI-WELL GROUNDWATER SAMPLING

A temporary mini-well can be installed by driving the *STRATAPROBE* 2.0" O.D. casing rod with an expendable stainless steel point to the desired depth within the water table aquifer. ¾" or 1" I.D. pvc mini-well is then installed in the casing. Once the desired length of pvc screen and riser is placed into the cased hole, the casing rod is retracted exposing the pvc. Groundwater flows past the screen and into the void space of the pvc. Samples are then obtained using either a 0.70" O.D. (minimum) disposable or stainless steel bailer or by using a peristaltic pump and inert tubing.

Semi-permanent groundwater wells can also be installed using the above procedures and providing a sandpack around and 2' above the pvc screen and a bentonite seal to the surface. Traffic well boxes can also be installed for protection of the well.

4.0 Soil Vapor Sampling Procedures

4.1 Discussion

Soil vapor samples are obtained by using a 1.5-inch O.D. PRT (post run tubing) point holder and a hardened drop-off steel point. The point holder is threaded onto the leading edge of 1.5-inch O.D. probe rod and advanced to depth using the *STRATAPROBE* direct push system. The probe rods are nominally 4-feet in length and additional rods are connected to reach the desired depth.

Once inserted to the desired depth, the probe rod is retracted slightly to expose the vapor sampling port. A 3/8" PRT fitting connected to 1/8" (or ¼" if requested) nylaflow tubing is inserted into the rod and connected to the point holder by spinning the tubing and threading the pieces together. A small rubber o-ring on the PRT insures an airtight seal.

Soil vapor can then withdrawn from the inert nylaflow tubing using a 60 cubic centimeter (cc) syringe connected via a three-way valve. The proper assigned purge volume is first withdrawn from the tubing and flushed out using the three-way valve. The next 60 cc of gas are withdrawn in the syringe, plugged, and immediately transferred to a mobile lab for analysis within minutes of collection. The use of small calibrated syringes allows for careful monitoring of purge and sample volumes. This procedure ensures adequate sample flow is obtained without excessive pumping of air or introduction of surface air into the sample.

After a sample is obtained, the sample tubing is removed from the probe and disposed of. This design prevents clogging of the sampling port and cross-contamination from soils during insertion.

4.2 Soil Vapor Implants / Monitoring Mini-Wells

At each vapor monitoring probe location, H&P's truck-mounted hydraulic probe may be used to advance interconnected 4 ft lengths of 1.5" steel rod to the required depth. The rod is then removed and 1/8" nylaflow tubing with a small airstone filter is inserted into the open borehole. Based on the borehole volume, 6" to 1' of sandpack are poured down the borehole to encase the filter. Approximately 1' of granular bentonite is then poured down the borehole and hydrated to seal the probe. The well can then be completed to the surface with hydrated bentonite or additional implants may be place in the boring at desired depths as it is built to the surface. Refer to Exhibit A for diagram. In unstable soil conditions, the implant and materials can be inserted into the probe rod as it is retracted.

The top of the line may be terminated by various methods. Generally, the top is terminated and plugged using a 2-way valve. This allows a variety of devices to be connected later if needed. Swagelok fittings and/or pressure valves are also available for connection to pressure monitoring equipment.

These vapor implants can be semi-permanent and protected with well boxes for future sampling events.

5.0 Decontamination Procedures

5.1 Discussion

Decontamination procedures are selected based on soil conditions, type and degree of contamination, and type of sampler used. In all cases, drive rods and samplers are wiped free of loose dirt and foreign material.

Soil and groundwater samplers, and rods if necessary, are disassembled and put through a three step wash and rinse cycle which includes:

- phosphate-free detergent, brush and de ionized water to remove soil and debris
- rinse with tap water
- rinse with deionized water

Soil vapor sampling rods and external are cleaned of excess dirt and moisture between each location. The probe's internal nylaflow tubing is also flushed with hundreds of cubic centimeters of air between sampling locations. If contamination levels in excess of 100 ug/L-vapor are detected the sample tubing is replaced. Sampling syringes are flushed with clean air after each use.

Additional decontamination procedures including a high temperature, high pressure wash system or the use of specific cleaning compounds may be incorporated at the client's request.

6.0 Miscellaneous

6.1 Field Collection Log

The field technician maintains a log sheet summarizing depth of penetration, refusal, which probe was used on each sampling location, when tubing was replaced, any visual contamination on the probe, and any other unusual occurrences which occurred at a particular sampling location.

6.2 Hole Abandonment

Hole abandonment procedures are based on the geology encountered, the depth of the hole and workplan requirements. Granulated bentonite is normally used to completely fill the probe hole. The bentonite can be hydrated or mixed with cement as a grout if requested.

©H&P Mobile Geochemistry, Inc. 2008

7.0 Health and Safety Practices

7.1 Equipment inspection procedures

Prior to the commencement of work, the following components of the Strataprobe platform should be inspected:

- ◊ Controls - all controls should be clear of obstruction, should be accessible from level ground, and should be free of dirt, water, or any other substance that may inhibit proper use.
- ◊ Hoses and hydraulics - all hoses and hydraulic components should be configured to move freely. All hose "pinch points" should be eliminated. The hydraulic fluid reservoir should be inspected for dirt, water, and the proper fluid level.
- ◊ Derrick / mast - the derrick / mast assembly should be inspected for signs of cracks or stress. It is recommended that the vehicle be grounded via a minimum four foot copper rod in the event of inclement weather.

In addition, the following tools should be inspected:

- ◊ Concrete and asphalt coring equipment / power tools - power cords should be free from cracks and weathering, bits and cutting edges should be sharp and clean.
- ◊ Sample collection equipment - drive pipe should be straight and free of burrs. All samplers should be clean, free of signs of stress, and work freely.
- ◊ Generator - should be properly ventilated, fueled, and have the proper noise abatement equipment installed.

7.2 Personal Protection Equipment (PPE)

The nature of Strataprobe work normally requires the use of varying levels of PPE, which includes but is not limited to:

- ◊ Head protection - hard hat
- ◊ Ear protection - ear muffs or ear plugs
- ◊ Eye protection - safety glasses
- ◊ Hand protection - chemical resistant gloves
- ◊ Foot protection - ANSI approved safety footwear
- ◊ Body protection - TYVEK suits, splash aprons, etc.
- ◊ Respiratory protection - full face air-purifying respirators.

7.3 Emergency Response

The nature of the Strataprobe sampling platform presents various operating hazards. It is primarily a hydraulically operated system. The possibility of leaks, over heating, fire, and personal injury do exist.

In the event of a hydraulic leak:

- ◊ Disengage the PTO (Power Take Off). Turn off the vehicle engine.
- ◊ Contain any spill or contamination of hydraulic fluid.
- ◊ Determine the source of the leak. If it is at a fitting, attempt to stop the leak by tightening or re-seating the fitting. Teflon tape may be employed to create a better seal.
- ◊ If the leak is in a hose itself or some other inaccessible area, the vehicle may need to be serviced by a professional.
- ◊ Assuming the repair is successful, start the vehicle engine, engage the PTO, and test the system. If a leak persists, shut down the operation and call for service.

In the event of overheating:

- ◊ Disengage the PTO. Turn off the vehicle engine.
- ◊ If the overheating is in the hydraulic system itself, check the reservoir fluid level. A lack of fluid may cause the system to overheat.
- ◊ If the overheating is in the hammer, allow the hammer to cool. Excessive use can create extreme heat.
- ◊ If the overheating is in the vehicle engine, allow the engine to cool. Check the cooling system for proper coolant level. Add coolant if necessary. Check the radiator / fan assembly for obstruction. Air must flow freely across the radiator, and the fan must turn freely.

In the event of fire:

- ◊ Access the situation. Is the fire too big or involved to safely extinguish? If the fire is small and localized, use the extinguisher if it is safe to do so. **REMEMBER: most fire extinguishers only work for 5 to 10 seconds**. Will that be enough time to put the fire out?
- ◊ If the fire is not put out or is too involved, call 911.
- ◊ Don't be a hero. Property can be replaced, but lives cannot.

In the event of personal injury:

- ◊ Treat the victim as necessary. Stabilize the individual and seek professional medical assistance. If someone else is available, stay with the individual and send them for help. If it is obvious that the injury is critical and a telephone is available, treat the injury as best as possible and call 911 immediately.

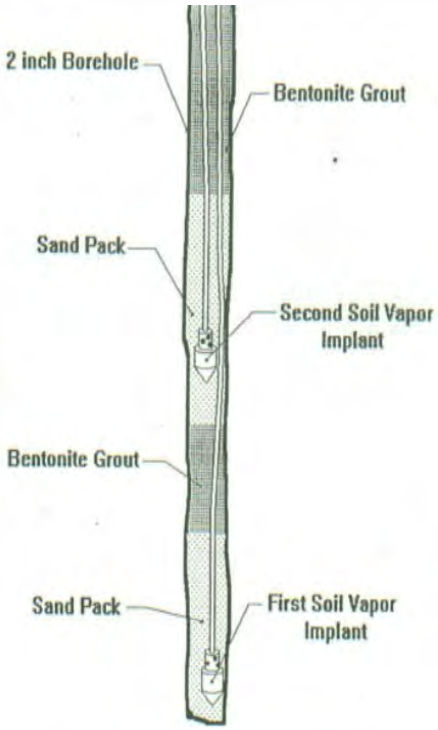
SCHEMATIC DRAWING OF VAPOR WELL



HP Labs Soil Vapor Implants

GENERAL FIELD SAMPLING PROCEDURES
Direct-Push Sampling Technology

Site investigation activities including soil and groundwater sample collection were completed using direct-push equipment. This technology typically uses a lightweight hydraulic drive point system mounted to the rear of a pickup truck. The hydraulically powered probe is advanced through soils by pushing or hammering. The probe rod is approximately 2.0 inches in diameter and utilizes a 1 inch by 24 inch split barrel sampler. The system drives the 2.0 inch casing to within approximately 2 feet of the desired sampling depth. Once the sampler has been advanced to the top of the sampling interval, the stop-pin for the piston point that is located inside the cutting shoe is released and retracted using extension rods. The sampler is then advanced through the sampling interval. As soil enters the sampler, the piston point is displaced upward into the sample tube. The sampler is then retracted from the probe hole and disassembled.

Prior to initiating field direct-push activities a site utility survey and hand clearing of the proposed investigation points was conducted. An independent subsurface utility survey company was retained to perform locating of onsite subsurface utilities and/or to clear the immediate area of proposed investigation points. A subsurface utility survey typically includes but is not limited to visual site inspection, metal detection, conductive electromagnetic induction, and non-conductive ground penetrating radar surveillance. The selection of the appropriate technologies is determined by the utility survey company. In coordination with the onsite utility survey, Underground Service Alert of Southern California was notified and requested to confirm the absence of subsurface utilities. Pursuant to the site utility survey and based upon the survey findings proposed investigation points may be relocated.

Following the location of subsurface utilities and the final selection of proposed investigation points hand clearing of utilities is performed. If necessary, concrete cutting is performed by a qualified subcontractor. The concrete core is removed and hand augering of soils is performed to a minimum depth of 4 feet below ground surface to confirm the absence of utilities at the selected point. The auger used is approximately 3 inches in diameter. Hand augered soils are replaced and compacted into the auger hole to provide rod support during direct-push activities. If need be, sand is added and compacted to bring the proposed point up to surface elevation.

During the investigation, BBC Environmental, Inc is responsible for managing the implementation of the overall job scope and observing field subcontractors during the implementation of their specialty service onsite. Safe operation of subcontractor equipment and safe management of subcontractor employees is the responsibility of the subcontractor.

Soil Sampling

Soil samples are typically collected at five (5) foot intervals, at significant changes in lithology, or as deemed necessary to properly characterize the subsurface strata. Soil samples are withdrawn from the sampler in a 1 inch by 24 inch acetate liner. The acetate liner is removed and Teflon™ squares are placed over each end of the sample and capped. Each sample is labeled with the project number, boring number, sample depth, technician's initials, and date and time of collection. After samples have been labeled the corresponding identifying information is also recorded on the soil sampling

log and/or chain-of-custody. Samples are then transferred to an onsite mobile laboratory for immediate analysis, or placed in a cooler with ice and maintained at a temperature of less than 4 degrees Celsius until their transport to a state-certified laboratory for analysis.

Soil Vapor Screening and Soil Classification

During sampling activities, soil adjacent to the laboratory sample is screened for organic vapors using a photoionization detector (PID). The selected soils are placed in a zip-lock bag, sealed, and manually broken up in an attempt to release potential soil vapors. The PID probe is then inserted into the bag through a small opening in the seal and a reading is taken and recorded on the air monitoring log and/or boring log. Similarly, adjacent soils are removed from the sampler and described in accordance with the Unified Soil Classification System. For each sampling interval, field observations of soil type, color, density/consistency, moisture, and grading are recorded on the boring log.

Groundwater Sampling

Groundwater samples were also collected to address potential hydrocarbon impacts to first encountered groundwater beneath the site and/or in the site vicinity. A minimum of one groundwater sample was collected from each boring within the upper 2 feet of the water table. Depending on field observations, deeper sample(s) may also be collected. Groundwater samples are typically collected using either hydropunch equipment or by advancing temporary piezometer casing through which sampling can occur. Prior to groundwater sampling a field measurement for phase separated hydrocarbons (PSH) is performed using an interface meter capable of detecting PSH at a detection tolerance of 0.01 feet.

Hydropunch equipment obtains groundwater samples by advancing a split barrel tube containing a shielded stainless steel well screen with an expendable point. The sampler is threaded onto the probe rod and advanced directly into the aquifer in the shielded position. At the desired depth, the probe rod is retracted approximately 2 feet causing the expendable tip to drop off and exposing the stainless steel screen. Groundwater flows past the screen and into the void space of the sampler. Samples are obtained using a 0.5 inch diameter bailer.

As an alternative, temporary piezometer casing is advanced through the open bore hole and directly into the aquifer at the desired depth. The temporary piezometer casing consists of solid and screened sections of 1 inch polyvinyl chloride (pvc) pipe. The screened section of the pvc pipe is placed so that the screen interval is partially submerged into groundwater. Groundwater flows past the screen and into the void space of the casing. Samples are then obtained using a 0.5 inch diameter bailer.

All soil and groundwater samples collected during the event were stored in a cooler with ice and kept at a temperature of less than 4 degrees Celsius until delivery to a state-certified laboratory. Sample handling and relinquishment is performed under standard chain-of-custody protocols. Groundwater parameters such as temperature, pH, electrical conductivity, turbidity, oxidation reduction potential, and dissolved oxygen may or may not be collected at the time of sampling depending upon the requirements of the regulatory approved workplan.

Chain-of-Custody Protocol

Chain-of-Custody protocol is followed for all soil and groundwater samples selected for laboratory analysis. The chain-of-custody form accompanies the samples from the sampling locality to the laboratory, providing a continuous record of possession prior to analysis.

Direct-Push Equipment Decontamination Procedures

Prior to its initial use and subsequent to each boring installation the pushrod and direct push equipment will be disassembled and have performed a three step wash and rinse cycle that includes:

- Brushing to remove soil and debris in tap water with an added phosphate–free detergent
- Second rinse with tap water
- Third rinse with distilled water

Boring Abandonment

Boring abandonment is completed using a granulated bentonite pellet/chip that is hydrated to create a slurry grout. The grout is typically emplaced by using the pvc casing or push rods as a tremie in an effort to prevent bridging of the seal material or borehole collapse. The granulated bentonite is poured directly into the boring and hydrated from the total depth of the boring to within approximately 0.5 feet of ground surface. Concrete or a matching surface cover will be placed from approximately 0.5 feet bgs to ground surface to seal the boring.

Waste Stream Identification and Disposal

Generated waste streams from this scope of work are anticipated to be minimal to non-existent. Direct-push sampling is a technology that minimizes waste stream generation such that no soil cuttings are anticipated. Decontamination water and any other waste liquids generated will be removed from the site by the drilling contractor for proper manifested disposal or placed into 1-55 gallon drum that will be sealed, labeled, profiled, and stored onsite until transportation to an appropriate disposal facility is arranged. Transportation and disposal of waste streams is typically conducted within 90 days of the drilling event.

SUBMITTER Client

COMMENTS

This laboratory request covers the following listed samples which were analyzed for the parameters indicated on the attached Analytical Result Report. All analyses were conducted using the appropriate methods as indicated on the report. This cover letter is an integral part of the final report.

Order No.	Client Sample Identification
1122227	B-4
1122228	B-5
1122229	B-6
1122230	Trip Blank
1122231	Laboratory Method Blank

Thank you for the opportunity to be of service to your company. Please feel free to call if there are any questions regarding this report or if we can be of further service.

ASSOCIATED LABORATORIES by,

Edward S. Behare, Ph.D.
Vice President

NOTE: Unless notified in writing , all samples will be discarded by appropriate disposal protocol 30 days from date reported.

The reports of the Associated Laboratories are confidential property of our clients and may not be reproduced or used for publication in part or in full without our written permission. This is for the mutual protection of the public, our clients, and ourselves.

SAMPLE ACCEPTANCE CHECKLIST

Section 1
Client: BBC Env Project: City of Escondido
Date Received: 11-01-10 Sampler's Name: (Yes) No
Sample(s) received in cooler: (Yes) No (Skip Section 2)
Shipping Information: _____

Section 2
Was the cooler packed with: X Ice ___ Ice Packs ___ Bubble Wrap ___ Styrofoam
___ Paper ___ None ___ Other _____
Cooler or box temperature: 4 / 1 C
(Acceptance range is 2 to 6 Deg. C.)

Section 3	YES	NO	N/A
Was a COC received?	X		
Is it properly completed? (IDs, sampling date and time, signature, test)	X		
Were custody seals present?		X	
If Yes – were they intact?			X
Were all samples sealed in plastic bags?	X		
Did all samples arrive intact? If no, indicate below.	X		
Did all bottle labels agree with COC? (ID, dates and times)	X		
Were correct containers used for the tests required?	X		
Was a sufficient amount of sample sent for tests indicated?	X		
Was there headspace in VOA vials?		X	
Were the containers labeled with correct preservatives?	X		
Was total residual chlorine measured (Fish Bioassay samples only)? *			X

*: If the answer is no, please inform Fish Bioassay Dept. immediately.

Section 4
Explanations/Comments

Section 5
Was Project Manager notified of discrepancies: Y / N N/A

Completed By: M. Gilbert Date: 11-01-10

QA REPORT FORM

Determinative Method : EPA 8082 Preparative Method: EPA 3545

QC Sample: 265696-1127674

Matrix: SOLID

Analysis Date: 11/30/2010

Batch Date: 11/29/2010 (pcb-112910s)

Applies to: LR 265696 & LR 265760

MATRIX SPIKE / MATRIX SPIKE DUPLICATE RESULTS

REPORTING UNITS = mg/Kg

Test	Sample Result	Spike Added	Spike Recovered		% Rec		RPD	QC Limits	
			MS	MSD	MS	MSD		RPD	% Rec
Aroclor 1260	ND	0.500	0.576	0.550	115	110	5	35	50-125

**** Outside Control Limits due to matrix interference***

ND = Not Detected

% Rec - MS & MSD = Percent Recovery from Matrix Spike & Matrix Spike Duplicate

RPD = Relative Percent Difference of Matrix Spike and Matrix Spike Duplicate recoveries

N/C - parent sample concentration of non-spiked Aroclor exceeded the linear range of the instrument and made spike calculation not possible.

LAB CONTROL SPIKE RECOVERY / METHOD BLANK

REPORTING UNITS = mg/Kg

Test	Spike Added	Spike Recovered	% Rec LCS	QC Limit
Aroclor 1260	0.500	0.546	109	70-130

Method Blank = All ND

% Rec - LCS = Percent Recovery from Lab Control Spike

Danielle Roberts

From: Walter B. Craig [w.craig@bbcenvironmental.com]

Sent: Thursday, December 09, 2010 9:49 AM

To: 'Danielle Roberts'

Subject: RE: Western Yard

Danielle:

Per our conversation, I saw that the SB-10 groundwater sample came back with MTBE and PCE hits in it (see lr265761). I also saw that the SB10-5 soil sample had some minor hits of TPH as well (see lr265760 (1)). That said, I would like to run the SB10-16 soil sample for VOCs as soon as possible.

I will complete my review this afternoon and let you know if there are any other samples we may want to run.

Thanks, -w.

SAMPLE ACCEPTANCE CHECKLIST

Section 1
Client: BBC Engineering
Date Received: 11-24-10
Sample(s) received in cooler: (Yes) No (Skip Section 2)
Shipping Information: _____
Project: Escondido public work
Sampler's Name: (Yes) No western land

Section 2
Was the cooler packed with: ✓ Ice ___ Ice Packs ___ Bubble Wrap ___ Styrofoam ___ Paper ___ None ___ Other _____
Cooler or box temperature: 3.5 C

(Acceptance range is 2 to 6 Deg. C.)

Section 3	YES	NO	N/A
Was a COC received?	✓		
Is it properly completed? (IDs, sampling date and time, signature, test)	✓		
Were custody seals present?		✓	
If Yes – were they intact?			✓
Were all samples sealed in plastic bags?	✓		
Did all samples arrive intact? If no, indicate below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were correct containers used for the tests required?	✓		
Was a sufficient amount of sample sent for tests indicated?	✓		
Was there headspace in VOA vials?			✓
Were the containers labeled with correct preservatives?			✓
Was total residual chlorine measured (Fish Bioassay samples only)? *			✓

*: If the answer is no, please inform Fish Bioassay Dept. immediately.

Section 4
Explanations/Comments

Section 5
Was Project Manager notified of discrepancies: Y / (N) N/A

Completed By: Henry A Date: 11-24-10
